FOREWORD

Throughout most of the 1970's, the structure of agriculture was a concept known mainly by social scientists in agricultural universities. As a research topic, it was at least peripherally studied by a few hundred economists and sociologists of agriculture plus a few political scientists and anthropologists. The scientists who took agricultural structure as a specific focus numbered only in the dozens.

This pattern of the 1970's is illustrated by a recent Current Research Information System (CRIS) search on the structure of agriculture. This search listed the structural-related research conducted in the land grant universities and through the Department of Agriculture. Most studies were done by agricultural economists interested in specific structural variables, such as farm size or sales, as they related to specific commodities, such as beef cattle or wheat. The sociological research projects on agricultural structure were less frequent, probably because there are several times more agricultural economists than rural sociologists in university experiment stations and USDA research agencies. Sociological interests appear to focus more upon farm-community issues than commodities.

This interest is evidenced in a background report Public Policy and the Changing Structure of American Agriculture (Peter M. Emerson. Washington, Congressional Budget Office, 1978. 70 p.) and in a study on Changing Character and Structure of American Agriculture: An Overview (Washington, General Accounting Office, 1978. 152 p.). Two other reports followed in 1979 which were prepared for Congress by the Economics, Statistics, and Cooperative Service (ESCS) of the USDA. (ESCS is now Economics and Statistical Service (ESS).) These publications are Status of Family Farm (Washington, U.S. Department of Agriculture, Economics, Statistics, and Cooperative Service, 1979. 51 p. Agricultural Economic Report No. 434) and Status of the Family Farm: Second Annual Report to the Congress (Washington, U. S. Congress. Senate. Committee on Agriculture, Nutrition and Forestry, 1979).

Meanwhile, a March 1979 speech plus a series of regional hearings by USDA Secretary Bob Bergland gave impetus and vigor to the concern for the structure of agriculture as a policy as well as a research issue. Furthermore, the new policy emphasis on the structure of U.S. agriculture led to publication in 1979 by ESCS on Structure Issues of American Agriculture (U.S. Department of Agriculture. Economics, Statistics, and Cooperative Service, 1979. 305 p. Agricultural Economic Report 438) and Another Revolution in U.S. Farming? (Lyle P. Schertz. Washington, U.S. Department of Agriculture. Economics, Statistics, and Cooperative Service, 1979. 445 p. Agricultural Economic Report 441). These have been joined by A Dialogue on the Structure of American Agriculture: Summary of Regional Meetings, November 27-December 18, 1979. (Washington, U.S. Department of Agriculture, 1980. 116 p.).

But while agricultural structure has gained widespread recognition as a policy issue, there remains a gap in scientific research knowledge needed to build a strong foundation for an effective policy on agricultural structure. The acute policy needs have exceeded the research base. The previous studies by several dozen scientists around the country must be expanded. This type of policy and research dilemma is not unusual but is

nevertheless a problem to be overcome. The comprehensive, scientific research needed as a policy basis--research using systematic sets of structure measures as applied across various commodities and social contexts of farming and agriculture--is still to be done.

One research project that will address this need was conceived in 1978 and formally initiated in 1979. It is Project S-148, "Changing Structure of Agriculture: Causes, Consequences, and Policy Implications," conducted by the State agricultural experiment stations. A team of sociologists, agricultural economists, and other scientists from most Southern States and several Midwestern States are pursuing four research objectives to: (1) identify and measure characteristics of farms and related activities as organizational units; (2) assess the impacts that external variations in social, economic, and institutional factors have on farms of various sizes and types; (3) assess the impact of organizational characteristics and career commitment and well-being of individuals and families on farms; and (4) assess the development of farm size and types as related to population change, patterns of man-land relationships, and community structure.

S-148 is scheduled through 1984. Still other regional and State experiment station projects, SEA projects, and ESS studies are being developed or recast toward collection of better data and the testing of structural hypotheses.

Such efforts will help to describe, predict, and explain the changes in the structure of agriculture. Once that foundation is laid, policymakers and the citizenry they represent should be better able to effectively control these changes to achieve desired directions in farming and agriculture which, in turn, play a vital role in national and international human well-being.

The purpose of this bibliography is to offer references to various scientific and policy materials already available on the structure of agriculture. It is hoped that the compilation of materials will help to hasten the creation of a scientific knowledge basis for policy and its social ends.

Ronald C. Wimberly
Compiler

INTRODUCTION

This bibliography was extracted from the Agriculture On-Line Access (AGRICOLA) family of data bases for the years 1970-1979. The various subfiles which comprise AGRICOLA vary widely in matters of coding, in-depth indexing, and abstracting. There is also duplication between various subfiles. Because of these problems and because the compilers wished to retain the abstracts and indexing terms included in the American Agricultural Economics Documentation Center (AAEDC) subfile this bibliography was divided into two parts, Part I: AGRICOLA, Part II: American Agricultural Economics Documentation Center. Part I and Part II, as published, do not duplicate each other. All AGRICOLA citations were matched against the AAEDC subfile and where duplication between AGRICOLA and AAEDC occurred only the AAEDC entry was retained. The remaining AGRICOLA citations were then matched against each other and only a single version of the citation was retained.

Both Part I and Part II must be used concurrently to obtain full coverage of the subject. The Table of Contents for each part is based on the category code schemes used by Technical Information Systems and the American Agricultural Economics Documentation Center, respectively.

Comments on this publication should be addressed to:

Extract: This paper focuses upon the teaching tools made
available by the recent introduction of time-share computing
into extension education. Instead of beginning with a
discussion of principles, an application of time-share
computing decision-aids as part of an educational program in
the development of good feeding systems will be discussed.
Attention will be turned to other applications; to how one
goes about organizing such an activity; to the interface
between applied research and extension, between departments,
and between universities; to the interface of computer tools
with other extension teaching aids; and to integration with
service activities including feed nutrient evaluation
laboratories.

Extract: This paper contains one of the training modules
utilized in Dynamic Coop Board Training, a training program
for Agricultural Cooperative Boards. The program emphasizes
the group dynamics of the manager-directors team in the
overall management function of the cooperative. Working
together as a total board, participants learn, and improve
skills through experiential process and independent study. The
program is applicable to a wide variety of Agricultural
Cooperatives. Objectives: 1) To review the fundamental
elements of Transactional Analysis as it relates to the
individual and people problems in agricultural organization.
2) To provide a basis for further discussion and better
understanding of people problems.

Abstract: Benchmark data for farm fatalities are developed and analyzed by region and age groups. During 1969-71, occupational fatality rates for farmers and hired farmworkers were between 23.5 and 28 per 100,000 workers. The fatality rate for all farm residents and workers in 1973 was 16.2 per 100,000 persons, down from 17.7 in 1967. Fatalities occur with much greater frequency to persons age 55 and over than to persons under age 55. A greater proportion of self-employed farmworkers are in this higher risk age category than are hired workers, implying that overall occupational fatality rates for self-employed operators are higher than for hired workers.

Extract: This paper contains one of the training modules utilized in Dynamic Coop Board Training, a training program for Agricultural Cooperative Boards. The program emphasizes the group dynamics of the manager-directors team in the overall management function of the cooperative. Working together as a total board, participants learn, and improve skills through experiential process and independent study. The program is applicable to a wide variety of Agricultural Cooperatives. Objectives: 1) to review fundamental elements of the operating statement and balance sheet and analysis of those elements. 2) to provide a common ground of knowledge for more advanced discussion of financial statement analysis.

Extract: This article examines the "small farmers" in Virginia's agriculture. The question of "What is a small farmer?" is addressed. The number of "small farmers" and their relative location by county is presented. The "Small Farm Program" being conducted in selected counties of Virginia using local technicians as extension aides is introduced. Also, the results of a recent study to determine the characteristics and potential of selected small farm operators in Floyd and Brunswick Counties of Virginia are discussed.

Extract: Development of Sunkist Growers, Inc., is one of agriculture's success stories of the 19th and 20th centuries. A pioneer among federated farmer cooperatives, its accomplishments have encouraged cooperative development both at home and abroad. As Sunkist continued to grow and change, the need for this publication arose. This publication provides information about the Sunkist organization and the scope of its operations. It should be helpful to those organizing or operating farmer cooperatives, regardless of commodities handled, size of organization, or geographic location. The underlying reasons for the beginnings of Sunkist, because of their varied nature, are particularly important.

Abstract: A detailed, quantitative analysis, not only of costs and returns to education in an agricultural university in India, but also of the components of the costs and returns and from that, the bases for improved educational policy. The analysis is an evaluation of the first agricultural university in India, G. B. Pant College of Agriculture and Technology, founded in 1960 on the model of land grant universities in the United States. Of interest to public policy is the return on the investment of society's resources. Therefore, the social rate of return is estimated. However, it is useful to understand factors affecting the demand for education. For this reason the private rate of return is estimated.

Abstract: This report presents a socioeconomic profile of approximately 207,000 hired farmworker families (including 9,000 migrant families) participating in the Food Stamp Program in November 1975 and identifies various factors related to program participation. These families contained approximately 1.1 million family members, averaging 5.3 members per family. Hired farmworker families were almost twice as likely to participate in the Food Stamp Program as all U.S. families. Family income and size, ethnicity, and region were highly associated with farmworker family participation. In addition, the socioeconomic characteristics of farmworker food stamp families differed considerably from those of all hired farmworker families and all U.S. families receiving food stamps.

Extract: I have sketched out some ideas in this paper which may help move us together into assessments of social impacts of agricultural technology. I have stressed the need to properly identify what we mean by social impacts in terms of where they occur, and the need to stay up to date on methodological advances in measurement and analysis. There is an additional need for us to learn to produce and package social impact assessments for timely, effective communication to the public, for it is in the arena of public decisionmaking that social impact assessment has its major justification.

Abstract: Students enrolled in agriculture programs at Washington State University, community colleges, and vocational agriculture in high schools were surveyed concerning various aspects of farm employment. The study confirmed the poor image students hold of farm employment. The major disadvantages of farm employment were lack of responsibility given to workers, low income and limited advancement potential. Salary expectations and reservation prices for farm employment were also obtained.

Extract: Our purpose is to explain the evolutionary process that has tempered the structure of property rights in the agricultural sector and discuss how these rules have affected resource allocation. To understand this process, we must first understand what is meant by property rights and what factors determine how these rights change. Within this context six periods in American agricultural history will be briefly examined: the adjustment to new conditions in colonial America, the formation of a national land policy, westward expansion, the closing of the frontier, the new role of government, and the recent environmental movement. An understanding of the factors influencing major changes in the institutional framework should provide insight into what lies ahead.

Extract: The purpose of this note is to clarify the effect of income tax rates upon the present value of income streams subject to normal income taxes and to describe how income tax effects may be incorporated into general valuation formulas. The next section discusses the relation between present value analysis and bid-price models and notes some practical limitations of the latter. Subsequent sections describe how risk can be correctly incorporated in present value calculations, how normal income taxes affect present values, and how the availability of tax-exempt municipal bond interest affects the present value of taxable income streams and limits the optimum level of taxable investment income.

Abstract: Wide distribution of land ownership has been a long established policy. Nonfarmers often successfully compete with farmers for ownership of land. The authors conclude that insofar as access to land determines the control of U.S. agriculture, "the key answers probably come from sources outside the agricultural sector." If farmers are to retain any control over changes in land-use policies, they must continuously articulate the needs and contributions of agriculture.

Extract: This note considers only the possibility that farm-value assessments can help to prevent premature and excessive disinvestments in agriculture in urban fringes--prevent the discontinuance or debilitation of agriculture before urban users are willing to make high urban offers for all of the farmland in an area. It is argued that the usual process for allocating taxes in urban fringes discourages the continuance of agriculture wherever efficient farming requires large real estate improvements that must be maintained and occasionally replaced but lack value for nonfarm purposes. Evidence from two New York City urban fringe counties is used in support of this argument.

Extract: The first step in developing this evaluation was to
review the basic agricultural resources in Nepal and to
project goals for their longrun development and use, drawing
upon public expressions by government officials. The second
step was an attempt to classify and itemize major constraints
to achieving the expressed goals. Six broad categories of
constraints were considered to be physical; technological;
economic; manpower; demographic, social, and cultural; and
institutional, including those of a political and
administrative nature. A major premise was that longrun
economic development of a major sector of the economy, such as
agriculture, could proceed in an orderly and effective manner
only through the choice of some overall development strategy
to serve as a guide in the selection of programs and projects,
in establishing priorities for development, and in allocating
funds and other resources.

Abstract: A theoretical model is developed to examine and illustrate some relationships between cost-indexed support prices and land values. The model is developed in the context of a single-commodity, price-uncertain world in which policy makers are allowed to control the percentage of nonland operating costs and the percentage of land costs covered by the support price. The model demonstrates that the time path of land values can be quite sensitive to policy parameters. Attempts by policy makers to guarantee a "fair" rate of return on land may have substantial impact on future land values.

Abstract: This article reports data assembled from 11 ERS publications. The original material was obtained from an employment study by a national committee of education, labor, and agriculture members using data from the Census of Population. Employment in occupations requiring agricultural competencies totaled 8 million, but should be adjusted upward by a million or more additional farm workers. Data are also presented by states.

Abstract: This article discusses the influence of various factors on price of land. Many of these--commodity prices, capitalization costs, real estate taxes, government farm programs, technology--affect land prices through the capitalization concept. Nonfarm demand is an important factor in some areas. Effect of credit terms and of buying land as a hedge against inflation are less certain. In each market various factors have a differing relative importance.

Abstract: The rates of increase in land prices between 1950 and 1975 were similar in most North Central States, reflecting the competitive nature of markets for farm products and farm real estate. Rates of increase in land prices were not related to nonfarm demand for land nor to land productivity. They were slightly higher in states where the percentage of transfers for farm enlargement were above average.

Abstract: This publication is a chronological review which examines research literature concerning women in rural areas. Research covered begins in the 1930's and continues to the present. Following the review is a discussion of research methods and theories, a list of research questions and needs for the future and a concluding commentary on the present status of women in rural areas. The commentary is based on popular literature, attitude surveys and current events. All research studies included in this review are abstracted in Appendix A. Popular literature, monographs, and agricultural bulletins on the subject of United States rural-based women are also included in this bibliography. Additional references are cited in appendixes B-F, covering international literature, bibliographies, and periodicals, on rural American women.

Abstract: A manager's central role is making choices among uncertain outcomes. A teaching approach is reported which uses decision trees and portable computer terminals to help managers analyze the component parts of a decision; clarify the risk involved in each action; and help to analyze that risk in a systematic, understandable manner. The analysis, whether or not to graze stocker cattle on wheat, embodies production and marketing risk for both cattle and wheat.

Abstract: The annual North Dakota farmland market study reported a December, 1976, average value of land and buildings of \$325 per acre. This represents a 14 percent increase over 1975 study results. Estimated average values of crop and pastureland are reported by State Economic Areas. Characteristics of buyers, sellers, and of the tracts sold were examined. Farm expansion continued as the dominant force in the North Dakota farmland market in 1976. Study presents estimated crop and pastureland values by State Economic Areas

Abstract: The study was undertaken to develop and test a model capable of simulating the changes in national and regional variables relating to agricultural production as the level of sheet and rill erosion from cultivated lands is controlled. The model incorporates the major agricultural commodities and determines their pattern of production in 223 areas of the continental United States. Within each area, nine land classes were defined based on the erosion characteristics of the soils. The production of the alternative crops is allocated to these areas and land classes based on their economic advantage and compatibility with restraints.

Extract: This paper will explore the effect of a particular agrarian reform in the Peruvian sierra on the nutritional status of its Indian inhabitants. The complications encountered in attempting this task made it impossible to state definite conclusions about the interaction between agrarian reform and nutrition. For this reason, this paper will attempt, not only to point out the successes and limitations of a certain agrarian reform strategy, but also to note where serious gaps of knowledge exist, and show that current research methods must be more comprehensive and

then added to arrive at the maximum that can be paid.

 Abstract: This publication suggests and illustrates a method by which farmers and other prospective buyers can estimate the maximum amount they are able to pay for farmland. The method employs two approaches, one in which the maximum debt that can be paid off by given combinations of rate of interest, length of term and amount of annual payment is shown in tabular form, and the other in which amounts of debt per \$1.00 of payment are shown. In the latter the amount of annual payment is used as a multiplier. In both cases the amount of down payment is

 Extract: The report begins with an overview of agricultural development and policy in Sierra Leone. The methodology used in data collection in Sierra Leone is then briefly described. This leads to an identification of the various farming systems in use in Sierra Leone and a description of land use patterns associated with them. The next section is a detailed description and analysis of factors affecting labor use and wages. Capital and input costs and returns are then estimated to provide budgets for each farm type and the return to family labor. Finally, two alternative rice production systems--one using improved biological technology and the other mechanical technology--are examined for their impact on output and employment.

Abstract: This report is intended as a guide for community leaders concerned with planning for sewage sludge disposal and for farmers considering application of treated sewage sludge to their land. The perspectives of both the sewerage agency and the farmer are explicitly recognized. The publication discusses what sludge is and the economics of some critical decisions in a sludge application program: selection of an application site, sludge handling alternatives, rate of application, cropping patterns, and the pricing of sludge. The publication concludes with some guidelines for implementing a sludge management program.

Abstract: The role of education in production is studied for the medium-stage developing agriculture of Taiwan. Results suggest that, in a densely populated agriculture where production is typically carried out by small family farms, education of farmers of a moderate level (about six years of schooling on average) is able to contribute to production when rapid development is in progress. Unlike in U.S. agriculture, the contribution of worker effect surpasses that of allocative and scale effects, suggesting that the relative importance of these effects may vary with farm size and with the average level of education.

Doc Type: MONOGRAPH Location: AGE

Abstract: In this study, three tables common to all Input-Output studies; the Transactions Table, the Direct Requirements Table and the Interdependence Table, were developed using primary data for all industries except agriculture which was developed from secondary data. The Input-Output Model is composed of 74 producing industries, 9 final demand sectors and 9 final payments sectors. During 1967, the economy of Northeast Texas recorded total sales of goods and services valued in producer's prices of \$5.58 billion. Wages received amounted to \$1.59 billion; residual income amounted to \$38.8 million; taxes paid to federal, state and local government amounted to \$330.96 million. Total exports exceeded total imports by \$358.4 million in 1967. Crude petroleum was the largest single export. The final demand multipliers ranged from 2.27 for the dairy processing industry to a low of 1.029 for the apparel industry.

Source: EXP STN Doc Type: MONOGRAPH Location: AGE

Abstract: The economic formula described in this report provides a basis for automatic and timely adjustment in Class I milk prices, which change when economic conditions in the marketplace change. Factors included in the formula recognize that cost of production and consumer demands influence the dairy farmer's milk prices. Other factors included in the formula reflect the cost of alternative milk supplies and the alternative opportunities for dairy farmers' resources. The formula was reviewed in various hearings on milk pricing and submitted to the Governor's Milk Study Committee. The Committee reviewed the research and recommended the formula to the 1974 legislature. Subsequently, the formula was included in three separate bills submitted to the 1974 Legislature. One of the bills (House Bill 47) was adopted by the 1974 Legislature and signed into law by the Governor as Act 31.

Abstract: Recent data describing structural conditions and trends in the Nebraska feed industry are available from three sources: 1) the 1969 Census of Agriculture, 2) a mail questionnaire survey and 3) U.S.D.A. estimates. Results are summarized in this report. Nebraska feed firms tend to be large relative to those of most other western states. They are also much more diversified, primarily into grain handling, custom mixing and pelleting and agricultural chemicals. Inclusion of revenues from these latter sources makes Nebraska firms still larger relative to those of the Western states surveyed. Nebraska formula feed manufacturers in the 1,000-ton-per-year-and-above size range produced almost 3.6 million tons of output during 1969; this is less than half of the industry's capacity. Of this total output, more than 2

million tons were accounted for by primary feed producers. Meal feeds for cattle, sheep and hogs were the primary manufacturers most important products. Wholesale channels were the single largest means of disposition of manufactured feed, although custom mixing and grinding were also important activities.

 Abstract: Performance criteria imposed by those working with small farm development vary greatly at the government, industry, and farm and technical assistance levels. In specifying relevant performance goals, a return to basic values, belief and felt needs of those farmers is essential, followed by adaptation of theory, conventional wisdom and traditional research and development organizations to more specifically address those felt needs. Research and training programs must both understand the aspiration of small farmers and provide for the changes possible within their given resource environment while identifying opportunities for improving that environment.

 Abstract: A review of the literature reveals confusion about the role of agricultural, economic and social phenomena in the diffusion of innovations. Professional pride has affected the performance of the scientific community in achieving an integrated approach to agricultural innovation and change. In this paper, basic grains are discussed relative to the U.S. hybrid seed experience and a more recent experience in Guatemala. Why small farmers do or do not adopt innovation depends on various socio-economic conditions and perceptions as they seek to avert and augment their incomes.

 Abstract: Based on the assumptions and input-output relationships used in this study, beef feeding alternatives increased the income potential for most types of farm situations--particularly in situations with few crop alternatives and relatively large land-labor ratios and in areas with several crop alternatives and relatively small land-labor ratios. Feeding beef heifers appears to be somewhat more profitable than feeding steers under price relationships that have prevailed in recent years. If we discount for risk by increasing the charge for annual operating capital the relative profitability of beef feeding declines significantly. If risk factors are important considerations in enterprise decisions, beef feeding may offer no real income advantages at all in many farm situations. The potential for increasing farm incomes by finishing more beef seems to be best for beef feeding systems using corn silage as the primary ration component.

Abstract: Growing concern over the need for bargaining power of farmers has led to proposals for creation of bargaining board systems. An analysis was made of alternative operating policies for such a board if established in the western late potato system. Of the policies tested, those based on acreage and revenue increases gave results most favorable to producers. The results imply that a bargaining board in the industry could increase revenue per unit of production, but restrictions on resource use would be necessary. The extent of gains obtainable in a commodity system would depend on its particular supply and demand characteristics.

Abstract: Every farmer develops some expectations about the economic and political climate in which he is going to operate. Conditions influencing the general price level, trade policy and prospects, and farm and food policies provide the background for an assessment of the longer run growth in food demand and the capacity of U.S. agriculture to supply the food needs. Producers will be "pushed and pulled" in diverse directions. Some impacts on the structure of agriculture including size, productivity and ownership plus economic organization and marketing practices are discussed from the managers perspective.

Abstract: Control in agriculture is shifting to those
individuals or firms that make the buying, selling and
producing decisions because they have control of the resources
and/or have access to markets for selling their products,
buying supplies and technical information. Brief answers are
given to the myriad of questions asked on the assumed dominant
organizational systems of: 1) independent farmer in an open
market, 2) corporation farming, 3) cooperative system, 4)
government intervention, and 5) a synthesis of the other four
systems. The answers cover issues and effects on property and
property rights, market performance and organization,
production efficiency, prices and competition, investment
capital and credit and numerous other concerns of the people
in attendance at the seminars conducted.

Extract: The overall objective here is to provide information concerning alternative management adjustments to an energy crisis. More specific objectives are to provide information about how a Grade A dairy farm operator might adjust crops grown and feed purchases in response to rising prices of energy-related inputs relative to prices of outputs and other inputs, or in response to circumstances of limited availability of energy inputs; and to compare the expected income, crops grown or purchased, and energy usage for crop production resulting from alternative technologies. Specific technological alternatives evaluated for a typical dairy farm are the effects of a liquid manure system compared with a solid manure system and the effects of conventional corn tillage compared with no tillage (no-till) corn production.

Abstract: Reduced government participation in grain production and marketing and a generally freer movement of commodities are the apparent new trends in farm policy for the 1970's. Growth of population, rising incomes, and foreign trade policies are the factors that will most largely affect the size of grain markets in this decade. Farm policies and expanding markets will influence the types of grains produced and marketed, the location of production and consuming centers, and the total volumes of grain produced and marketed. These changes, in turn, will have a significant impact on other sectors of our economy.

Extract: The purpose of this study is to determine the relationship between cow turnover (percent of cows leaving the herd) and profits, as measured by labor and management income per operator. Based on recommendations from authorities in the dairy cattle industry, longevity is considered important. This study was designed to measure the relative importance of the effects of longevity on cow turnover on profits. Also analyzed were selected farm business factors which affect profits and how these factors are related to cow turnover. Commercial dairy operators need economic guidelines on culling practices to use in their efforts to maximize profits from their dairy operations.

Abstract: This study related the attitude of members toward co-ops with their co-op's financial performance. The sample of 450 members was from three groups of cooperatives whose financial performance was good, fair, and poor. The attitude toward co-ops, in general, was the same among the three groups, except that members of poor performing co-ops were less willing to believe in the marketing and service orientation of co-ops. Attitudes toward their local co-op were positively related to their co-op's financial performance, patronage, and years as a patron. Older members were more loyal to cooperatives in general, but not toward their local. No relationship was found between attitude and income, farm size, and farming experience. Illustrative concepts members agreed with were: favorable prices rather than higher refunds, retire equity of deceased and relocated members, higher interest on equity would increase patronage, and patronage is primarily due to convenience and services offered. A relatively high level of confusion or misunderstanding existed as to why farmers patronize their co-op, refund allocation, and who controlled the local co-op.

Abstract: The marketing bill-an estimate of all costs and profits incurred in transporting, processing, and distributing farm food products-totaled \$75.3 billion in 1971, up 5.9 percent over 1970. Among major cost components, labor costs accounted for almost half of the bill, packaging materials, 12 percent and transportation, 8 percent. Corporate firms derived \$4.4 billion before tax profits from marketing farm foods in 1971, about 6 percent of the bill. Increased prices of marketing services accounted for 46 percent of the increased marketing bill, and increased volume of products marketed also accounted for 46 percent, with additional service making up the rest. Consumer food expenditures were up 4.9 percent to

Abstract: Measures of output, input, and labor productivity
are derived for the food and fiber sector. They are used to
analyze changes in output, hours worked, and labor
productivity that have occurred in the food and fiber system
since 1958. A major result of the analysis is that the
reduction in labor at the farm level has apparently not been
reflected in either the input or product marketing sectors.

Extract: The purpose of this study was to develop procedures
for identifying the potential for growth in locally owned
farmer cooperatives. This was accomplished by first
identifying financial ratios associated with growth in this
type of business and then developing a model for predicting
growth. Simple regression models were used to identify
financial ratios associated with growth. Percent change in
total assets was selected as the best measure of growth.
Eleven financial ratios were identified as being significantly
related to growth in at least one of the two States in the
analysis.

Extract: The study reported here was designed to determine ways of overcoming obstacles that inhibit farm entry by low-equity potential farmers. It was expected that credit would be of primary importance to beginning farmers; therefore, the study was oriented largely toward credit as a means of getting established in farming. Specific objectives of this study were: 1. To determine through the case study technique how beginning farmers are financing their farms. 2. To ascertain lending institutions' policies concerning beginning farmers. 3. To develop alternative solutions that will assist low-equity potential farmers to finance a farm.

Abstract: The handbook includes summary information concerning farm labor regulations which affect Ohio agricultural employers and employees. Seventeen state and federal regulations are discussed: Ohio workmen's compensation law, federal minimum wage law, OSHA, employment of minors, hazardous occupations in agriculture, federal and state income tax withholding, social security taxes, SUA, unemployment insurance, migrant labor camp regulations, farm labor contractor registration act, transportation of migrant workers, retirement plans for employees and collective bargaining in agriculture. For each regulation, there is a discussion of objectives, coverage, employer provisions, employee provisions, responsible agency, and references.

Extract: This study is designed to examine the Champlain
Valley apple growers' dependence on various sources of harvest
labor. The study examines the relative productivity of three
main sources of labor and how that productivity has changed
over the past six seasons (1970-1975). The study should
provide a basis for estimating the number and productivity of
workers required to replace the Jamaican workers, if such a
shift does occur. Also, the study's productivity statistics
could be used to estimate minimum standards for apple pickers.

Extract: The objectives of this study were to identify the
differences in productivity of the three main sources of
harvest labor, and to examine productivity changes over six
seasons (1970-1975). Two sets of dependent variables were
examined -- productivity per worker, both hourly and per
season -- and three input variables measuring the amount of
time spent harvesting. Three sets of explanatory variables
were used: labor source variables, a harvest size variable,
and grower variables.

Extract: This paper first explores the relationship between economic efficiency and farm size. It will be shown that large farms generally have lower production costs and that restrictive policies may therefore have some impact on overall economic efficiency. However, the efficiency costs are likely to be very small (depending on the degree of restrictiveness of the particular policy), especially in light of a chronic high rate of rural underemployment and unemployment. Second, it will be contended that, should size-restrictive policies be implemented, there are strong economic reasons for arguing that their primary effect will be to lower land prices and rents rather than to raise food prices.

Abstract: Farm production inputs have limited value without the knowledge of how to use them. From the early agricultural societies and farms to today's universities, experiment stations, extension services, and market information activities, public policy has been aimed to make knowledge equally accessible to all farmers. Likewise, policies to keep input supply markets competitive and to foster both supply and credit cooperatives have been intended to help all farmers. Lessened public support for these activities, the authors emphasize, would give an advantage to larger farms and lead to more concentrated agriculture.

Abstract: Changes now underway in the organizational system for producing and marketing farm products raise question as to what forces shape such a system, where present trends may lead, and what should be the basis for policy. Fourteen authors writing seven chapters describe trends, identify issues, and examine how four basic factors affect form of organization: access to farmland, access to technical knowledge and commercial inputs, access to markets, and policies relative to risk sharing, taxes, direct payments, pollution, and rural development.

Extract: We estimate that increases in U.S. grain exports
would be possible in 1980 if any one of three dietary
adjustments were made: (1) substituting soy protein for 25
percent of the meat consumed by U.S. consumers; (2) reducing
meat consumption in the United States by 25 percent; and (3)
substituting silage for 25 percent of the grain used in
producing beef in the United States. We also examine export
possibilities when all of these alternatives are applied
simultaneously. We also consider export possibilities when (1)
exports might be oriented more to the developed and affluent
countries, therefore emphasizing feed grain, and (2) exports
might be more oriented to the poorer nations with many
undernourished persons, thereby emphasizing wheat.

Abstract: Data were collected on farmers' viewpoints about various management factors, as well as the farm organization relative to crop and livestock production, milk sales, investment values, major farm costs, tractors and harvesting machinery, and off-farm work of family members also working on the farm. More consistent differences in values placed on various management factors were found among regions, particularly Baden-Württemberg and southern Illinois, than among size groups of farms in the three regions. Price differences among the regions were cited as an important influence relating to labor income. A higher proportion of the labor from the southern Illinois farms of under 100 hectares was spent in off-farm work than for the other regions. Suggestions were made for obtaining more intense production by farm families desiring to spend more working time on farms. More intense educational assistance for limited resource farmers was suggested.

Extract: This study has as its primary overall goal to establish economic guidelines that will aid farmers in making management decisions to maximize profits. The analysis focuses on three specific objectives: 1. To determine the quantities of irrigation water available, seasonally and in total, and the fixed, variable, and total costs for this water. 2. To analyze (a) how variations in water quantities and costs affect changes in relative profitability of alternative crops and land use within the relevant technology and price structure and (b) how these changes, in turn, relate to optimum resource allocation and affect profits earned. 3. To establish criteria and analytical guides for farmers to use in allocating resources and in making adjustments to such allocations within a context of varying water quantities and prices.

Abstract: Estimates of costs, prices and rates of production are presented as guides for projecting net farm income from alternate combinations of crop and livestock enterprises. Projected prices are long run conservative estimates for 1977-1982. Costs and production rates are those found on Illinois farm record keeping farms with average to above average management. Input-output coefficients are given in both physical and monetary terms. Inputs cited include fertilizer, crop costs, labor, power and machinery, feed, other cash expenses, and capital investments in buildings and equipment, updated periodically.

Abstract: The flue-cured tobacco industry is in a state of transition as farmers are replacing the traditional harvest methods with modern bulk curing systems. The rapid trend toward harvest mechanization experienced in 1972-75 will continue into the eighties, according to an analysis of a wide range of quota levels and wage rates. Adopting new harvest technology is profitable for farmers, and it will have an impact on the demand for harvest labor. In the aggregate, however, harvest mechanization will not cause serious unemployment problems in the flue-cured tobacco belt. During 1972-80, with increased wage rates, the decline in the number of harvest workers is projected to range from 64,000 workers, under a "high" level of production, to 199,000, under a "low" level of production.

Abstract: The study reports on the allocation of farmers' time between labor and management activities. The data are based upon personal interviews with 97 North Dakota small grain producers. Allocation of time to management increased from 21 percent for the smallest farmers to 41 percent for the largest farm size group. The time spent in labor and management is also reported by season of the year. Management activities are divided into planning, labor supervision, marketing products, purchasing inputs, record keeping, information gathering, and land acquisition. An estimate of the time spent and the farmers' perceived importance of each is also presented.

Abstract: This report opens with a discussion of the stages and goals of father-son farming agreements and briefly examines father-son employer-employee agreements. It presents the characteristics of partnerships, how to avoid a partnership, and keys to a successful partnership. It illustrates both the equal and unequal sharing types of father-son partnerships. It presents various provisions that the father and son may consider in discussing their future partnership, with the recommendation that these ideas be presented to their attorneys for inclusion in a written agreement. The report is an updating and replacement for the North Dakota Agricultural Experiment Station Bulletin No. 457 (Revised).

Abstract: The report analyzes the economic impact on the farm producers of the sugarbeet plant being planned by the Red River Valley Cooperative, Inc, at Hillsboro, North Dakota. The analysis indicates that both cash flow and net returns to growers will be enhanced through participation in the operation of the proposed cooperative. Net returns are substantially improved over the existing cropping alternatives when the sugarbeet enterprise is added to a hypothesized farming operation in the plant area.

Extract: These uncertain times call for a change in management strategy. They call for more emphasis on efficiency, buying, and selling; control of risk to acceptable levels and; constant adjustment of the production system as product and input prices change. The future cannot be predicted with certainty. Therefore, the manager cannot always be "right" as he looks back on decisions made earlier. However, a manager can analyze the consequences of a decision for different kinds of future situations which have a reasonable chance of occurring.

Extract: Estimates of the minimum capital required to provide a \$7,000 return to operator's capital, labor and management were made for 23 subregions in the Southern states for five equity levels and two classes of enterprise alternatives. Equity levels of 0, 25, 50, 75, and 100 percent were used in the analysis. The enterprise situations were specified as: 1) all feasible enterprises in each study area were considered as alternatives, and 2) enterprise alternatives were restricted to beef and associated feed production enterprises.

 Extract: This work is published to aid in the analysis and planning of fruit farms. This data should not be considered as representative of all fruit farms in Michigan; however, they are typical of many types of commercial fruit farms. The farms are divided into three groups based on total farm investment. Included for each part are five tables: Income and Cost Summary; Value of Farm Production; Farm Costs; Size and Organizational Factors and Crop Production Factors. Each table includes not only the figures for the type of farm, but also a place to write in your farm figures for comparative purposes. The data presented give the reader a perspective of the amount and composition of the inputs used and the way the businesses were organized. The report is a summary of 29 Telfarm records for 1975 kept by Michigan fruit and vegetable farmers, from the major fruit producing areas near Lake Michigan.

Extract: Selecting a farm business management strategy for combating variations in product prices and input costs is very important, given the current economic environment. This article compares eighteen selected dairy business management strategies on the basis of historical level and variability of net income before and after taxes, and corresponding labor and investment requirements.

Extract: The purpose of this study is to provide information and suggestions that will assist farm management professionals, educators, and farmers in managing labor efficiently. This study is an attempt to meet an area of need which has been expressed by farm operators and farm management professionals alike. The specific objectives of this labor management project are: 1. Identify the major factors that affect labor management 2. Observe and inventory the labor management practices in use on New York dairy farms 3. Compare practices in use and evaluate their effectiveness 4. Relate labor management practices to key farm business factors 5. Seek out successful techniques used in industry which might be applicable to farm employer/employee situations.

Doc Type: ARTICLE Location: AGE

Abstract: The value of remote access use of computerized decision aids to county and area Extension staff was studied in a one-year field trial. Three groups of agents were trained in the use of and given access to three computer programs. Each group was given a printing or touch-tone terminal or mail-in access. Availability of a remote access system had a generally favorable impact on Extension programs. Use of agent time and agent effectiveness were improved. Printing and touch-tone terminals were preferred over a mail-in system. Instant turnaround appears to be important primarily because it facilitates results interaction rather than any need for instant answers.

Who controls agriculture now?--the trends underway
 Kyle, Leonard R; Sundquist, W B; Guithen, Harold D
 Ill Univ Coll Agr Spec Publ 27: 3-12 Aug 1972
 276 IL623

Series: In Guithen, Harold D, Ed. Who Will Control U.S. Agriculture? Policies Affecting the Organizational Structure of U.S. Agriculture. Search: 19720800

Source: EXT Doc Type: MONOGRAPH Location: AGE

Abstract: In this review, the authors spike the mental images of a uniform, stereotyped kind of farming in the U.S. by showing not only wide differences in size and gross production of farms (one-eighth of all farms produce almost two-thirds of sales), but in who farmers are and how control is exercised. Interesting IRS data reveal some "farmers" who are "affluent" but manage to lose money in farming. Large industrial corporations are still a minor influence, but a third of livestock and an eighth of crops are now produced under many kinds of forward contracts. Perhaps most weighty of all are the more intangible trends toward industrialization of the entire food and fiber system--a vertical merchandising-oriented structure in which conglomerate firms may well play an increasing role. Continued advances in farming technology add to the seeming relentlessness of trends in control of agriculture. The major concern expressed is that if agribusiness conglomerates gain control of production and marketing of a substantial portion of the food supply, they would probably be able to control prices and boost profits unless restrained by govt action.

Abstract: A computer program designed to analyze major capital investments is presented and explained. The model uses discounted cash flows to analyze multiple investments in machines, land, buildings and groups of animals. Income and expenses can be unevenly distributed throughout the life of the investment. Inflation as well as federal and New York State (or only federal) taxes are handled explicitly. A budget generator develops income and expense flows on an annual basis during the life of the investment for dairy farm situations. The program can be used with or without the generator.

Extract: The principal objective of this study is to explore the main microeconomic factors that affect the supply of off-farm work among rural Taiwanese households. This study focuses on the rural household in an effort to understand the economic factors that affect off-farm work and attempts to measure the effects of these factors from farm level cross-section data. The main data used in this study were obtained from the 1973 records of 329 farm families distributed in the eight agricultural regions of Taiwan.

Extract: Recent surveys have disclosed three principal motivations for incorporating the farm or ranch. Estate planning has been the principal motivating factor in roughly 75% of the cases. Income tax minimization has been the most important inducement for several while limited liability has proven of primary importance to a few. In order to assist a client in the incorporation decision, it is useful to briefly analyze the reasoning behind each of these motivations.

Abstract: In this investigation estimated relationships of resource markets for United States agriculture are used in a simulation model to study resource demand and farm income under three conditions: (a) those actually prevailing, including the historic mix of agricultural policies, (b) with technical change in agriculture only half the rate realized, and (c) with a free market. The results indicate that compared with "actual" conditions the environment of slow technical change would have modest effects in slowing the demand for farm machinery and the migration of labor from agriculture. It also would result in greater net farm income in the 1960's. A free market would be accompanied by increased investment in farm machinery and a greater exodus of family and hired labor from agriculture. It also would result in a smaller farm building investment and a considerable reduction of farm income. Since economic conditions are so similar in both countries, the implications of these findings are related to Canadian agriculture on the assumption the same model would show the same outcomes for Canada.

Extract: The technology used in cotton production in the United States has changed dramatically since World War II. The rate of substitution of mechanical cotton harvesters for hand labor was quite rapid. The socioeconomic ramifications of the adoption of this new technology have been complex and far reaching. This note focuses on only one aspect of the economic impacts of adopting mechanical cotton pickers: the potential economic welfare gains to the producers and consumers of cotton in the United States.

Abstract: Despite massive off-farm migration and relatively
prosperous agricultural years, estimates of returns to factors
of production indicate that labor earnings in agriculture
remain low. This is primarily caused by farm factor market
characteristics and the resulting tendency of any increase in
farm income to be capitalized into land values.

Abstract: Model B-9 is the current version of a series of
models which have been under development at Purdue since 1968.
Basically these models have been designed with four purposes
in mind: 1. To assist in the teaching of current farm
management ideas by providing a mechanism around which
Extension programs can be organized. 2. To act as a teaching
tool indicating to a farmer what kind of data must be gathered
for adequate farm management. 3. To act as a decision aid to
farmers when planning cropping patterns, machinery
acquisitions, or other such decisions. 4. To point out to
farmers the value of resources used in the farming process.
This document serves to describe the computerized version of
B-9 on a technical level. The design of this document is such
that programmers involved in the project can deal with the
program.

Abstract: The study analyzes the direct and indirect
implications of technological change in agriculture, in
general, and for the Punjab economy, in particular. The main
focus is on tracing the implications in a dynamic framework
with an emphasis on feedback and growth linkages among
different sectors and economic variables. Both positive and
negative aspects of the green revolution have been analyzed.
Finally, it develops the conceptual framework to analyze the
implications of the dynamic interdependence between
technological change, income distribution and employment.

Source: USDA Doc Type: MONOGRAPH Location: AGE
Abstract: Census data made available from the Enterprise
Statistics program show substantial changes between 1954 and
1967 in ownership patterns and diversification by companies
processing food products and producing farm equipment and
machinery. Employment in these industries is shown to be
declining primarily among companies classified in the
industry, but increasing among companies primarily engaged in
other industrial activities. For example, the total number of
employees in the meatpacking industry dropped by over 49,000
between 1954 and 1967. The number of employees of firms
classified within the industry dropped by 61,000, but
employment in meatpacking establishments owned by companies
classified outside the meat industry rose by nearly 12,000.
Companies classified outside the industry accounted for 10
percent of meatpacking industry sales in 1967. Similarly, 27
percent of the farm machinery and equipment sales were
accounted for by companies classified in other industries such
as electrical machinery.

Extract: This report was prepared to provide information on the actual growth of cooperatives relative to the increase in cash receipts from farm products marketed and supplies purchased by all farmers, and on growth of the largest cooperatives relative to their counterparts in specified industries. The report covers the following information for each commodity: (1) Trends in cash receipts from products marketed and in cash expenditures for farm supplies purchased at 5-year intervals from 1950 to 1975, and a few comments on the general trends in each industry during this period; (2) the sales of cooperatives and their share of the farm market during this period; and (3) comparisons of the four cooperatives and the four other firms reporting the largest sales of four farm products and three farm supply items in 1960, 1965, and 1975. These comparisons include such data as sales of the given farm product or farm supply, total sales, total assets, and net worth.

Extract: The purpose of this study is to evaluate impacts for 1980 of two potential environmental controls; this evaluation is made by an interregional quadratic programming model. These potential environmental controls are assumed to be implemented on a national scale by possible government policies. One policy alternative limits the rate of nitrogen fertilization in U.S. agriculture. A second policy alternative removes four organochlorine insecticides from the market. The two alternatives imply a free market except for restrictions on the use of nitrogen fertilizer and the specified insecticides. The effect of these policy alternatives are compared with a base alternative that does not have restrictions on fertilizer and insecticide use. All three alternatives include (a) normal or trend export levels and (b) no supply control or price support programs. The effects of each alternative on interregional production patterns, land use, commodity prices, consumer food costs, and related items

Abstract: In the evaluation of key agricultural policies, a number of critical uncertainties arise for which little in the way of empirical evidence has been accumulated. The typical departmentalization within the agricultural economics profession fails to offer any hope of properly assessing these uncertainties. One approach that integrates the separate tasks of system analysis, econometric estimation, optimization and more pragmatic data collection and summarization efforts is adaptive control. This framework effectively combines the characteristics of dynamic systems, uncertainties, and the active accumulation of information. Implications are drawn for potentially rewarding applications in agricultural and natural resource economics.

Abstract: Cooperative adoption of a base plan for Class I milk helped stabilize milk receipts in a Texas Federal order market served largely by cooperatives. Dairymen under the base plan decreased their production of over-base milk, while those not under the plan increased their milk production. The plan had little effect on slowing the herd expansion rate for individual producers. However, the supply of base was fixed, and expansion did not generally occur unless producers brought additional base from producers going out of business. Larger producers with access to capital were the ones who bought base. Many new producers elected not to go under a base plan when they had an option. In the 3 years before the 1968 adoption of the base plan in Hopkins County, Texas, dairymen entering production increased by 15 percent in both the group of producers that was to go under the base plan and the group that did not. In the 3 years after adoption, dairymen entering

Source: OTHER US Doc Type: ARTICLE Location: AGE

Abstract: In fact, share-farmed lands yield as much as rented or owner-cultivated lands. In traditional theory, share-farmed lands yield less, for share tenants stint their efforts. This article shows that economists' standard assumptions about a market equilibrium reconcile theory with fact: when contracts are enforced, share farmers labor as diligently as others. Evidence is advanced that gain from the joining of tenant and landlord interests, not gain from the dispersion of agricultural risk, is the impetus to share tenancy.

Abstract: Access to markets is essential to a dispensed, proprietary farming system, but traditional access is deteriorating even as the interaction between farmers and markets gets tighter. Those who continue farming face these choices: Preserve access to an open market system or protect market access through group action. Rhodes notes possibilities in preserving traditional markets and comments on possibilities and problems in both bargaining and cooperatives as a means of group action. If farmers choose group action, new legislation and services will be needed from government to support bargaining efforts and foster democratic processes for group organization and action.

Extract: The demand for soybeans in both domestic and world markets is strong and is expected to continue strong into future years. The projected 1985 U.S. demand for soybeans is 50% above 1972-73 levels and exports are expected to double. This paper explores the competitive position of soybeans at various price-yield relationships. The relative profitability of soybeans at the farm level is a strong indicator of potential soybean supplies.

Extract: The analysis supports the hypothesis that farm operators have excess machinery capacity on their farms and can and do use this excess for farm enlargement. The 4WD tractor embodies more excess capacity than conventional tractors. The results of this study suggest that the 4-wheel drive tractor technology could displace as much as 4 percent of the agricultural labor force in the study area. This decline in the demand for agricultural labor is offset by a reduction in the yearly cost of production which more than compensates for reduced payments to labor by a ratio of 4.3:1. Additional impacts would be a decline in the total demand for farm machinery and the subsequent changes in the size and number of machinery dealerships.

Doc Type: ARTICLE Location: AGE

Abstract: A multiperiod household model of fertility behavior applicable to rural-agricultural settings in which the pecuniary as well as the psychic returns from children are significant is formulated. Implications regarding the effects of variables associated with the market for agricultural labor on the demand for farm children, including technical change, agricultural wage rates, farm value, and nonfarm employment opportunities, derived from the model are tested on U.S. aggregate data covering the period 1939-60. The empirical results obtained appear to support the theoretical model and suggest the importance of the reduction in the value of children as productive assets in agriculture as a factor in the postwar decline in the U.S. farm birth rate.

Extract: The purpose of this volume is to explain the general system simulation approach as a viable basis for providing input to planning and policy decision making in agricultural sector development. We do this through discussion of the philosophic orientation of the approach, its eclecticism with respect to modeling techniques and types and sources of data, its relationship to the decision-making process, and the establishment of its credibility with decision makers. We also discuss the prerequisites for institutionalization and use of the general system simulation approach for agricultural sector development planning and policy analysis within the agricultural decision structure of a national government. The development and institutionalization of the approach in Korea is detailed and conclusions are drawn about its transferability and preconditions for its use in other developing (or developed) countries.

 Extract: The major purpose of this study is to determine the interdependence (as expressed through a particular quantitative technique) in employment of the sectors that produce, process, and service the outputs from and the inputs to farming. The total agribusiness sector, encompassing all processes between the manufacturing of farm inputs to the retailing of food and fiber products, thus is considered the source of labor demands. Methods are applied to measure how a change in final demands for one sector of this agribusiness complex alters employment or labor demand in other sectors of the complex. The study also projects, subject to limitations of the method, how employment or labor demand may be distributed among sectors of the agribusiness complex in 1980.

stated that there is little to show for the immense efforts made over a period of many years to improve farm accounting and record keeping. This writer disagrees, and believes that farmers' accounting abilities and interests are not essentially different from those of nonfarm businessmen. Although farmers needs for and uses of financial records may have been unique in the past, they are today similar in many if not most respects to the needs of nonfarmers.

Extract: The primary objective of this study was to develop a better understanding of the methods of production and marketing coordination utilized by cooperatives in the fruit and vegetable industry of the United States. The principal focus of attention was devoted to ascertaining the methods by which cooperatives valued their inputs and their outputs. More specifically, the objectives of the study were: (a) to describe the physical coordination and marketing strategies used by different cooperatives in the fruit and vegetable industry for moving agricultural products from the farm to the consumer; (b) to describe and evaluate the relationship of different approaches to "invisible" coordination or pricing on the overall efficiency of the coordination process; (c) to identify the different sources of financing used by cooperatives and their impact on performance criteria; (d) to discuss the growth achievements of cooperatives in the fruit and vegetable industry and attempt to identify the growth-determining factors.

Extract: The major objective of this analysis is to estimate the effects of different farm-size structures on key variables of the rural community and the American economy. The variables to be examined are: number of farms, total income of the farm sector, net income per farm, cost of food to consumers, and employment and income generated in rural communities. To indicate these effects, outcomes under four different farm-size alternatives are compared for the year 1980. Each alternative represents a different size and scale of individual farming operation for American agriculture. Each of the farm-size alternatives is analyzed under two demand situations which differ basically in the level of grain exports estimated.

Abstract: Factors affecting growth of cooperatives were analyzed. Data were collected from 76 local firms on internal factors affecting growth, such as advertising. Census data were used to measure external sources of growth; expansion of trade area potential. During 1964-74, combined internal and external factors explained from 22 to 67 percent of the variation among firms in growth of grain sales and sales of farm supplies. Trade area expansion explained less than half of the variation in firm growth. This means that firm growth is not determined by just growth in market potential (non-controllable), but is much influenced by decisions firms make to achieve growth.

Extract: Before alternative stabilization policies can be developed, the objectives for which these policies are designed have to be specified and elaborated on by decision makers. Stabilization policies can be aimed at differing and sometimes conflicting objectives. Policymakers have to clarify which objectives will be supported and to what extent. After objectives are clarified, analyses should be made to determine which alternative approach best meets the stated objectives. For the purpose of this discussion, possible alternative stabilization approaches have been classified as (1) unilateral, (2) bilateral and (3) multilateral. Most of the grain market stabilization proposals that have originated in Congress, universities, the commercial sector and international organizations tend to fall into one of these three categories. The U.S. has taken action in all three, with recent emphasis on trying to develop bilateral and multilateral approaches to the problem.

Abstract: The purpose of this publication is: 1. To delineate in a conceptual fashion the "mid-western" approach to professional farm management--the manager's job, the various kinds of management organizations, the typical numbers of farms that are managed, the traditional services that are performed, and the usual fees that are charged for farm management, farm appraisals and other services. 2. To present a computerized program which one can use to budget a professional farm management business--one man, two-man, 10-man or more or less. The larger budget is in turn based on the various farm budgets for each type of farm--cash grain, hog, dairy, beef cow, feeder cattle, etc. that is managed. All of the receipts, expenses--both out-of-pocket and fixed--and income for a professional farm management business are thus developed.

Extract: To assist farmers in the choice of a tax accounting system and to evaluate the relative benefits of accrual compared to various cash systems for different enterprise types and sizes of farms, a multi-period growth model of the farm firm was developed. The objective of the analysis was to maximize the discounted after-tax income over a five year period through choice of an accounting system. Three accounting systems were compared for the various farm situations - 1) the accrual system, 2) the cash system with maximum cash adjustments, and 3) the cash system with optimal cash adjustments.

Abstract: Business managers, including farmers, constantly face alternative uses of their resources. In evaluating these uses, they must be concerned with the various costs and returns involved. These costs and returns frequently occur at different times. A dollar to be received in the future will not have the same value as a dollar today. The decisionmaker must compare these costs and returns even though they have different values. This report discusses mathematical procedures for comparing incomes and costs occurring at different times.

Abstract: Variations in equity and income of cattle producers have occurred as a result of wide variations in prices of cattle and feed sources. This large price uncertainty indicates a need for improved methods of risk management. This paper illustrates a procedure for evaluating the risk-return effects of selling weaned calves or holding them through subsequent production stages. Multiperiod risk programming was used to model the decision choices. Results indicate that vertical integration does provide a means for producers to effectively manage risk. The composition of the vertical production sequence depended on the rate of growth to be achieved over the planning period. The growth rate was determined by the ranch manager's willingness to accept risk, as well as other constraints to the growth process. In conclusion, an evaluation of vertical integration as a response to risk was efficiently accomplished by the use of risk programming.

Abstract: Application of an input/output model to the State's economy for 1963. The economy was divided into 4 major industry groups - primary agriculture, agricultural processing, manufacturing, and mining and services. Within the major industries 34 sub-sectors were identified and entered in the model. Unit income multipliers and weighted final demand multipliers were computed for each major industry and each sub-sector. The analysis indicated that income generation per \$ unit of output for the agricultural processing industry was greater than the service industry by a factor of 2 and of manufacturing and mining by a factor of 3. The unit multiplier for primary agriculture exceeded services by 40 percent and manufacturing and mining by a factor of 2.

Extract: The primary objectives of the study were to determine: 1) the extent and characteristics of corporate farming in Oregon; 2) the financing, input purchasing and marketing practices of Oregon's corporate farms; and 3) whether these characteristics and practices differed by type of corporation or the type of farming activity in which they were engaged. The information gathered also was anticipated to be useful in projecting possible community impacts of corporate agriculture.

Abstract: The rules, regulations and clogged flow of flue-cured tobacco in auction warehouse sales are a handicap to growers and buyers. Because of this, ERS periodically surveys the processing capacity to aid in sales volume decisions. The 1974 industry usable processing capacity is calculated at 93.8 million per week pounds, or 15 million over the modal sales week last year. Firms reported several factors that limit usable capacity.

Abstract: This paper reviews assumptions and policies associated with agricultural credit programs in low-income countries. Concessional interest rate policies are singled out for special attention. The author argues that these concessional interest rate policies stimulate consumption, discourage household saving, result in inefficient allocation of resources, and cause further concentration in income distribution. He also argues that it is virtually impossible to provide financial services to rural poor when real rates of interest are low.

Abstract: This publication explains agricultural policy formation as a process focus on communication to a goal - problem consensus, followed by research, design and evaluation of alternative policies, and final implementation and evaluation. The basic components of this process and their interrelationships are presented in a conceptual framework for training and policy evaluation with specific application to the credit policy area. Agricultural credit policy and programming is a complex set of interactions and concerns extending from the national policy level down to the individual small farmer in his management decisions. This paper attempts to illustrate the complexity and order in the policy formation process.

Abstract: State and local property taxes continued to rise in 1976 as costs of services provided by State and local governments increased. Property taxes on farmland also followed the upward trend, although not at the same rate. In 1976, farm real estate taxes for the United States totaled an estimated \$3,098.4 million, an 8.5 percent increase over 1975. All property taxes went up by 10.7 percent. The average tax per acre for the U.S. was \$3.17, compared to \$2.92 in 1975. Farm real estate values continue to grow at a rate higher than real estate taxes, which explains the drop in the effective tax rate from 78 cents per \$100 value in 1975 to 74 cents in 1976. In most cases, the increase in assessed values, rather than any changes in tax rates, has provided greater tax levies for State and local governments. Differential assessment tax laws have helped to lower the assessed values on farmland and thereby hold down the tax burden for farmers.

Abstract: Net farm income is the sum of enterprise net incomes. The enterprise mix of a farm operation affects farm net income's stability. Enterprise net income is production times price of product minus production expenses. I shall analyze changes in the stability of each of those net farm income determinants. I shall discuss how net farm income instability affects the economies of the Great Plains states and how net farm income instability may cause structural changes in Great Plains agriculture. I shall conclude by discussing problems that need research.

Extract: The particular implications pursued in this paper deal with the behavior of capital-labor ratios within the household, not the farms, of farm families. In particular, how do household capital-labor ratios of farm families respond to changes in the prices of family members' time, in family income, in family size, and in certain characteristics of the farm enterprise? In this paper two simple models of the farm family are outlined. One allows family members to work both on and off the farm, while the other provides for farm work only. Both the theoretical and empirical analyses neglect children's time and concentrate on the ratio of household capital to the wife's home time. The ratios for poor farm families in three counties in Iowa and North Carolina are analyzed and discussed in the light of the models. The data for the empirical analysis come from the Rural Income Maintenance Experiment (RIME), which operated 1969-72.

Abstract: Report provides farm planning data on production practices and resource requirements associated with potato production in the Red River Valley. The basic data were obtained from a survey of 120 growers producing potatoes under dryland conditions. Potatoes predominantly were grown following another crop, rather than on summer fallow ground. The most common rotation was to combine one year of potatoes with three years of small grain crops. More than half of the growers (62.5 percent) fall plowed their previously cropped land for potatoes. The common spring tillage practice on fall plowed ground was at least two field cultivations. The growers planted 93 percent of their total acreage with certified seed stock. While the average seeding rate was 14 hundredweight per acre, the rate varied from 6 to 23 hundredweight. Four-row potato planters was the size most frequently used. All but two of the producers interviewed applied commercial fertilizer.

All but three of the producers interviewed applied insecticides, with one application being most common. More than two-fifths (41 percent) of the potato acreage was planted for recertification.

Extract: If farmers are faced with fuel shortages sufficient to limit present farming practices, it will become necessary for them to adjust to alternative production techniques and harvesting strategies. It can be expected that alternatives adopted will be those that improve the net returns per unit of fuel used in the farming enterprise as fuel becomes the most limiting resource. Clearly, fuel-saving practices are available for farmers at present. But, there exist no reliable estimates of how much shortage can be absorbed by farmers before major shifts in practices and/or crops occur. The purpose of this paper is to estimate the effects of shortages of fuel on agricultural producers' output, income, and practices within a major commercial agriculture area - the Southern High Plains of Texas.

Abstract: The impact of the Unemployment Compensation
Amendments of 1976 concerning agriculture is analyzed. Seven
percent of the agricultural employers are subject to the law
and cover 43 percent of all hired workers. Actual benefits
averaged \$334 per beneficiary, while the potential benefits
could amount to over \$1,000. About half of the covered workers
have unemployment (average 13 weeks) and 2/5 are out of the
labor force for 23 weeks. Earnings average \$3,020, they are
supplemented by 13 percent in UI benefits. Other demographic
characteristics are discussed as well as implications for farm
employers. The cost rate of the agricultural UI program is 5.8
percent, but could be lowered if the state adopts a more
inclusive coverage provision.

Abstract: The main purpose of this study was to determine
the economic feasibility of on-farm feed processing via the
package feed center versus selected alternative methods of
feed procurement presently employed by operators of dairy,
hog, and beef cattle enterprises. The on-farm feed processor
must be willing to forego valuable services and other fringe
benefits provided by retail feed outlets, if he is capable of
accurately procuring, formulating, and mixing a complete
ration, then the on-farm package feed center appears to be an
attractive alternative feed procurement method which would
allow operators of certain livestock enterprises an
opportunity to lower their feed costs. Attractiveness of
on-farm feed mixing may vary from farm to farm by size of farm
and by geographic area, depending upon access to feed
ingredients and competitiveness of retail feed outlets.

Abstract: Unemployment insurance cost rates for newly covered employers and the corresponding tax burden under two sets of tax structures by type of farm are estimated by state. Livestock, dairy, and poultry farmers generally more than support the benefits their workers receive, which is not the case for fruit and vegetable farms. Under experience rating livestock and dairy farms tend to pay the minimum rate in half the states, while the maximum rate applies for fruit and vegetable farms in many states. Benefits received by workers vary also by type of farm and state and tend to be related to the cost rate.

Abstract: In previous periods when agricultural production was large relative to demand in North America, supply control through limitations in production and markets has been used. Large cropfalls and mammoth international purchases by the USSR during the early 1970s depleted North American grain stocks and caused major supply control programs to vanish. With more favorable worldwide weather, however, grain production and carryover have increased to levels where farmers may demand supply and market controls to improve prices and income. In contrast to conventional models, we make a quantitative analysis for the United States to three tax policies which might be used to restrain production and improve prices and farm income.

Abstract: Data are presented on thirty-three agricultural
lending institutions whose officers were interviewed in early
1977. The data relate to institutional characteristics, the
background of the lending officer interviewed, and
institutional preferences among types of agricultural loans.
These institutions range in size up to \$100 million dollars in
assets. The loan officers interviewed mostly had farm
backgrounds and had attained a bachelor's degree. They
expressed a strong preference for operating loans relative to
other types of farm loans.

Extract: The data in this report are the most detailed and
accurate financial records available of what is happening on
Michigan commercial farms. These figures are averages of
actual records on 658 farms for the year 1975. The farms are
also summarized by nine types of farms or enterprises. For
those who wish to do forward planning, these results can be
used as basic data and then adjusted for current conditions.
Labor, machinery, building, services or supplies, land, and
miscellaneous costs are stated per crop acre or per unit of
livestock production. There are also data on production
standards, feed fed, capital investments and hours of labor.
Data for this report is compiled from records of farm families
enrolled in Telfarm. This is a management education program
based on compiling and analyzing farm financial and production
records. The farms are mainly commercial farms in Economic
Classes I and II (over \$20,000 gross sales). Although 1428
families were enrolled in Telfarm in 1975, less than half of
the farms could be included in this report because of
incomplete data or a mixture of enterprises.

Extract: Each year science and technology makes it possible for larger farms to be operated more efficiently with lower unit costs. This puts pressure to expand on all full-time farm operators who expect to maintain a viable business over time. In addition, the rapidly rising opportunity cost for the operators' labor puts smaller cash crop farms at a competitive disadvantage, because large expensive machinery cannot be used to an advantage. This is summarized in Table 1. Those units which are over 800 tillable acres in size, and averaged 1,199.5 acres, had a cost advantage of \$33.21 per acre for just labor and machinery. The medium sized farms averaged 523.8 tillable acres with a cost advantage of \$17.39 per acre. The smaller farms averaged only 241.8 tillable acres. Farms of this size will have great difficulty covering all costs if they are operated as full-time commercial ventures during periods of normal returns. Many of the smaller farms are operated by semi-retired or part-time people.

Extract: Potato farm businesses are noted for wide fluctuations in earnings from year to year depending on unpredictable weather and prices. Nineteen seventy-five was a good year but not the best for potato farmers. There was a fair crop which sold at prices below the previous year's level. The average total production costs per acre rose 12 percent while income rose by only 3 percent. This resulted in a management income 44.5 percent as great as 1974. Potato farms are highly specialized units with substantial investments. The average unit controlled \$484,835 of the assets, of which 94 percent belong to the operator. The information contained in this report is summarized from the records of the potato farms participating in the 1975 Telfarm Project. These farms, scattered all over the state varied in production and marketing methods used. These farms should not be considered as statistically representative of all potato

Abstract: Recent energy and environmental problems in U.S. agriculture have stimulated interest in alternative technologies or systems of agricultural production. Large-scale, mechanized organic farms that use little or no inorganic fertilizers or chemical pesticides may be one such alternative. The crop production on fourteen matched pairs of organic and conventional Corn Belt farms was studied to determine the relative value of crop output, net returns, energy intensiveness, and labor requirements. The results of this preliminary study suggest that organic farming warrants more intensive research.

Abstract: From a complete list of commercial potato farms in Aroostook County and Central Maine, a sample, stratified by size of farm, was selected to obtain information on business organization, labor supply, capital investment, land use, varieties grown, production requirements, and potato sales. Costs and returns were summarized by size of farm, and some evidence of economies of size was observed. Most of the farms were operated as single proprietorships, using family labor supplemented with seasonal hired labor and, on the larger farms, some year around hired labor. Potato prices were well above average for the study year, resulting in high net returns. By contrast, a previous study, conducted in a year when the price received was low, showed a net loss.

Extract: This report is derived from accounts kept by dairy farmers enrolled in the TELFARM record Program through the Cooperative Extension Service and Michigan State University. The 470 dairy farms which supplied information for this report should not be considered representative of all dairy farms in Michigan. However, these farms are typical of Grade A commercial dairy farms with more than \$10,000 gross income. This report has three purposes: (1) to provide statistical information about the financial results on Michigan dairy farms during 1975; (2) to provide information on the trends in costs and returns on dairy farms from year to year; and (3) to provide a workbook for individual farm comparative analyses and forward planning.

Extract: The general objective of this research was to determine technically feasible waste-handling systems for Louisiana dairy farms and to estimate costs associated with each system. To accomplish this, it was necessary to first determine the kinds of waste-handling systems currently used on various dairies across the state. Data for this step were gathered in all areas of the state for various herd sizes in a survey of 70 dairy farmers. The second step was to develop model waste-handling systems feasible for Louisiana dairy farmers.

Extract: This publication was written with two primary objectives in mind. One was to bring together and organize for students, policy makers, and administrators some of the research, documented experience, and unresolved issues dealing with agricultural credit and savings in Africa. The second objective was to introduce some of the concepts and tools used in financial management. Here the general focus on small farmers is broadened to present some techniques which are useful to managers of large farms and agribusiness enterprises.

Extract: This report is based on results of a study of financial obstacles to and solutions for entry into farming. The study was stimulated by (1) a need for new (perhaps younger) farmers in agriculture reflected by demographic data on ages of current farmers, and (2) the importance of capital (and thus credit) for the viability of a commercial farm. This publication provides findings concerning alternatives offered to beginning farmers by financial institutions and

possibilities. These farmers are not generally able to pass higher energy input costs on to consumers, so higher energy prices will necessarily result in changes in the production process within the firm. These adjustment possibilities include shifting to more energy-efficient crops, reducing the amount of energy used per acre of a given crop, substituting other inputs for energy inputs, or selecting more energy-efficient farming practices and irrigation distribution systems. The potential for each of these possibilities is limited. Increased energy prices pose special challenges for the pump irrigators.

Abstract: Cost of production could replace parity as the common measure for assessing the equity of returns to agriculture. Parity has been cited as obsolete because of its inability to include productivity as a factor. Inherent difficulties within the cost of production measure, which does include productivity, are discussed, such as defining a basis for assigning costs to land and management. The problems both in measuring costs of production of farm commodities, and in linking target prices and loan rates to such costs are addressed. In particular, a land price spiral can occur when target prices and loan rates are linked to cost of production. The Congress inserted a provision in the Agriculture and Consumer Protection Act of 1973 which directed the Secretary of Agriculture to conduct a study of the cost of producing feed grains, wheat, cotton, and milk. While the intended use of results is uncertain, such data could provide a basis for future evaluation of loan rates and target prices.

Extract: The New York Farm Cost Account Project is a

research project which is a part of the Cornell Agricultural
Management Information System (CAMIS). Since 1914 data has
been published from detailed enterprise records kept by New
York farmers in cooperation with the Department of
Agricultural Economics at Cornell University. The farms are
located in most of the farming areas of the State. They are
generally well-managed, full-time, commercial farm businesses.
They are representative of the "better" farms in New York. The
reports present the results for individual enterprises and the
averages of the enterprise costs and returns for all farms.
They show not only the averages of costs and returns but also
indications of the variations and reasons for them. The
factors for individual enterprises are arranged according to
size of enterprise. The annual averages of the various factors
are not averages of average costs but are weighted by the size
of the enterprise.

Abstract: This publication contains the most significant

overhead cost factors from 30 cooperating farmers in the Farm
Cost Account project for 1976. These farms are generally well
managed, full time, commercial farm businesses somewhat larger
than average for the State. They are located in most of the
farming areas of New York State. This report presents the
results of the analysis of individual overhead enterprises and
the averages of each enterprise for all farms. Included are
data for tractor, truck, equipment, real estate and labor
enterprises. They show not only the averages of the enterprise
costs but also the variations and indications of reasons for
them.

Abstract: Environmental and conservation controls placed on cropland agriculture affect each region of the United States in a different way. Changes in gross income distribution among and within various regions of the country result from imposed cropland soil loss limits. Cropland management is used to reduce soil loss through choice of crops, tillage practices and conservation practices on each soil class in each producing area. The development and application of a large multiregion model of U.S. agriculture can be used to evaluate changes in national and regional farm income resulting from such imposed soil loss restraints. Restricting gross annual soil loss from cropland to 5 tons per acre and 3 tons per acre result in relatively small income changes when compared with an unrestricted production scheme. Income among the regions of the country does change as production of specific commodities is reduced by restrictive soil loss limits. In an example region it is observed that significant changes in the sources of gross farm income occur as soil loss limits become more restrictive and the composition of crops produced is changed.

Extract: This report outlines costs of production for 10 commodities: corn, sorghum, barley, oats, wheat, cotton, rice, soybeans, peanuts, and flaxseed. Total costs, including variable, machinery ownership, overhead, management, and land are computed and presented on both a per planted acre and on a per unit yield basis. Land costs are computed in two different ways; both composites. One composite uses current land values combined with share and cash rent, while the other uses an average acquisition value combined with share and cash rent. Costs are computed on a national basis, as well as on a regional basis.

Abstract: The structure, pricing, and performance of the
U.S. sugar industry were studied with special emphasis on the
industry's performance during the recent years of economic
stress. In addition to outlining some of the major causes for
high sugar prices in 1974, the study focused on the structure
of the sugar industry, price movements, price analysis,
performance of the industry, and outlook for the future. The
basing point system of sugar pricing was also
discussed--certain firms tended to be price leaders and others
followers.

Abstract: For 40 years the U.S. has taken a variety of
actions to improve prices of farm products and incomes of
farmers, without declaring that it had established a
policy, and without much public exposure outside the interests
directly involved. If the earlier pattern of continuous
surplus and low farm product prices should be reestablished,
farm policy would likely take the form that emerged late in
the 1960's. Under other circumstances problems will center
around how to fit an agrarian-rooted agriculture into a
commercial-industrial world. Participants will include many
groups in addition to farmers.

Abstract: The U. S. crop market is a complex system of
interacting supplies and demands that depends in part on
government programs and policies. A model of the crop market
that includes reserves and stockpiles has been developed as a
component of AGRIMOD, a dynamic simulation model of the U. S.
food production sector. First, a brief description of AGRIMOD
is given. Then, the crop market submodel which is formulated
as a nonlinear optimization problem with nonlinear constraints
is described in detail. The concept of a support supply
function is introduced to handle discontinuities caused by
government policies and a scaling procedure is implemented
that improves convergence. Finally, selected simulation
results are presented to demonstrate the use of the submodel.

 Abstract: The Central Bank for Cooperatives was designed to
 play an ancillary role handling loans within the system of
 Banks for Cooperatives. If the number of loans which exceed
 current lending capacity of district banks continues to
 increase, the Central Bank will assume a steadily increasing
 share of the responsibility in the loan decision area. This
 trend would be counter to the decentralization concept which
 underlies the structure of the system. Several suggestions are
 made to overcome the problem including pooling equity capital
 within the Banks for Cooperatives system.

Abstract: The interdependence between grain and livestock production calls for grain policies which will result in stable and reasonably priced inputs for livestock production. This article outlines the basis of the interdependence and the relationship between grain and livestock supply response. Increased grain price variability in the 1970's has caused instability in the livestock industry. Stabilization of grain prices in a range acceptable to both grain and livestock producers could lead to a more desirable allocation of resources, thus improving performance.

Abstract: Managing agriculture's export potential is important for national policy because exports are the dominant force in farm food markets and because their influence will continue to grow. Both political and economic considerations affect policymaking. The management rules adopted to supplement the free market will affect the level and stability of exports. Certain rules can stabilize export supplies, increase exports over time, and improve farm income without raising food prices. Programming both reserves and exports will be required to achieve these results.

Extract: The paper is organised as follows. In the first section the general nature of federal government policies is discussed with reference to the feed grains policy. The second section briefly describes the changing market environment within which the policy has been developed and implemented and points out some implications of these changes for the policy. The third section turns to an examination of the overall objectives of the policy and the way in which the policy has developed in an attempt to meet these objectives. The fourth section discusses what seem to the author to be the major outstanding issues and the implications of some of the alternatives while the fifth section offers some conclusions. Discussion, pp 82-87.

Abstract: Nontariff barriers have become one of the key
issues in agricultural trade policy and trade negotiations.
Laws and regulations of a country, in addition to being
directly protective, often give administrators wide leeway for
interpretation which results in restrictive trade flows. The
domestic agriculture of most developed countries is protected
by one or more of the following: quantitative restrictions,
licensing requirements, variable levies, export subsidies,
minimum import prices, import calendars, state trading, mixing
regulations, health and sanitary regulations, and standards
and labelling. Ultimately, nontariff barriers must be
negotiated like tariffs and other protective devices.

Abstract: Farmers' acceptance of government price support
and related agricultural adjustment programs is important to
the success of such programs. The research reported in this
article sought to explain factors which influence farmers'
acceptability of agricultural policy and farm programs.
Information to identify farmers' values and attitudes was
obtained by a mail survey. A questionnaire obtained farmers'
reactions to statements in six areas: (1) causes of the
current farm problem, (2) what a government farm program
for grain crops should accomplish, (3) degree of acceptance of
selected general farm programs, (4) means of raising farm
income, (5) farm programs and farming in general, and (6)
additional ways of dealing with the farm problem. An adapta-
tion of the Likert scale was used in obtaining attitudes. The
respondent was given a single statement or a number of
statements considered descriptive of attitudes towards a
specific area. The respondent indicated his agreement or
disagreement on a five point scale: strongly agree, agree,
undecided, disagree, or strongly disagree.

suggest that if the trend toward increasing farm size continues, an even higher percentage of all rented land will be in the larger farms. This implies greater reliance on part-owner operations, particularly among farming operations that require large acreages. Estimates are based on the 1969 Census of Agriculture and pertain chiefly to farms with gross annual receipts of \$2,500 or more.

Abstract: Estimates are made of possible effects in Indiana of a part-farm general cropland retirement program, operating with and without the type of commodity programs that existed until 1970. Conclusions are drawn from estimates for four major groups of crop and livestock farms in each of five areas of Indiana. Results showed, among other things, that percentages of total cropland in corn, soybeans, and wheat would probably increase with or without the commodity programs. The increase would be greater without the programs.

Abstract: A significant amount of U.S. farmland, in terms of both acreage and total market value, is rented. There is wide variation, however, depending on farm size and type of enterprise. Reliance on leasing increases with size of operation. Compared with owned land, a higher percentage of all rented farmland is in the larger farms. Tenure patterns vary considerably by type of farm, with leasing being most important in cash grain enterprises. These relationships

Extract: I wish to argue in this paper that the major changes which have occurred in marketing in the United States are related to technological change. Often, technological change manifests itself in specialization of labor, which affects markets as well as the size distribution of firms. Using that as a base, I will advance the position that future changes in marketing will result from current and future technological changes. That will be followed with a discussion of the potential effects these changes will have on our research-teaching-extension programs in marketing.

Abstract: Fluctuations in agricultural export earnings of Kenya, Nigeria, Tanzania, and Zaire were found primarily associated with variations in the quantity exported, which were due in part to actions of government marketing boards. A secondary source of export quantity variation was variability in rainfall. As fewer different crops accounted for shares of agricultural export earnings, countries actually became more specialized. An inverse relationship was found between export crop diversification and the level of agricultural export

Abstract: The direct Government payments made to farmers
under the Agricultural Act of 1970 have the purposes of
encouraging needed production adjustments and supplementing
farm income. This report develops a conceptual approach and
utilizes it to estimate the income supplement share in 1972
farm program payments. Of the total direct payments of \$3,531
million for feed grains, wheat, and cotton under the 1972
program, 25 percent of the feed grain payment, 48 percent of
the wheat payment, and 92 percent of the cotton payment are
estimated as income supplement. Of the total, about 46
percent, or \$1,642 million, is estimated as income supplement
for 1972. These estimates of income supplement are based on
the concept of a discriminating monopsonist. The minimum
payments required to achieve 1972 levels of set-aside with the
government acting as a discriminating monopsonist are
classified as production adjustment payments. All payments in
excess of this amount are classified as income supplement
payments.

Abstract: A statewide survey indicates that farmers lack
general knowledge of the economic concepts underlying
agricultural policy issues. Expanded education for farmers and
agricultural organizations could enhance their knowledge
concerning farm problems. Analysis indicated that the
significant variables of their perception rating were
geographic location and land operational status (mainly a
renter, owner, or owner-renter). The data were obtained from a
list of indicator statements given in the survey.

Extract: In the first section of the paper "real" prices
received by farmers in 53 countries are presented. In the
following section, a long run aggregate agricultural supply
elasticity is estimated by fitting a supply function to cross
section data. In the third and final section, this supply
elasticity is used to estimate the loss of agricultural output
and resulting social costs in countries exhibiting relatively
low farm prices.

Abstract: This report consists of several parts. The first
part consists of analysis of the characteristics of 13
marketing co-ops and 5 farm supply co-ops serving
limited-resource farmers in Louisiana. Multiple regression
analysis was conducted with data from both types of
cooperatives to determine factors related to percentage net
margins on operations. The second part deals with a "model"
vine-ripe tomato packing. The third part discusses a combined or
multi-purpose co-op operation involving both tomato packing
and farm supply operations.

Extract: This paper first discusses how different market structures can affect farm income levels and economic stability and then spells out some of the implications of prospective international commodity trade agreements for farm income levels and stability and discusses some of the problems in successfully negotiating agreements. Since the focus of the paper is on economic instability in an international setting, the type of markets discussed largely pertains to that structure within which international trade in basic commodities is carried out.

Doc Type: MONOGRAPH Location: AGE

Abstract: Previous analyses of trade and development problems of U.S. agriculture have neglected the role of exchange rate policy. An attempt is made to understand the role of the exchange rate on these problems in a non-parametric fashion by means of a model of induced technical change. It is argued that the overvaluation of the dollar and the policy measures to combat it aggravated the adjustment problems of U.S. agriculture, especially during the 1950's and resulted in shifting an important share of the benefits of technical change to the consumer. Moreover the recent devaluation of the dollar constitutes an important structural change for U.S. agriculture.

Abstract: The parity concept and parity price are defined and examples given. A history of farm strikes is given and tied into the 1977-78 farmer's strike. Economic effects of full parity pricing are outlined. A paradox is discussed as it is hypothesized that full parity would lead to a rapid reduction in numbers of medium size farmers. Suggestions are given for farmers about replacing their demands for full or high levels of parity with other demands.

Abstract: Three alternative scenarios for future farm production patterns and the implications for financing are developed. The most likely scenario appears to be a continuation of present trends toward fewer and larger farms. A few large farms will dominate farm production with a large number of small farms continuing whose operators will use most of their income from off-farm sources. More equity financing would occur under this scenario. Without too much departure from present trends, farm production would move to the second scenario of corporate ownership of production resources with hired management and hired labor. Corporate-type financing of selling securities and borrowing from large banks would prevail. The third scenario of a large number of family farms appears least likely without direct intervention by policymakers. More subsidized lending would be needed under this scenario.

Abstract: Public agricultural price and income policy has served as an important economic force for almost half a century, affecting the welfare of farmers, consumers, taxpayers, the rural community, and agricultural business. Recent dramatic economic events on both the U.S. and world scene suggest the urgent need to develop a research program that would provide the knowledge base for an effective and consistent future national policy dealing with price and income problems related to agriculture and food. This article suggests a conceptual framework for such research input reflecting discussions from a workshop of agricultural economists in the policy field that recently addressed this task. Five priority areas of research were identified: better characterization of the supply and demand forces; evaluation of grain reserve programs; generation of guidelines for further implementation of the current 1973 Act; analysis of alternative future policies; and an improved understanding of policy-making processes.

Abstract: U.S. exports of and total revenue from feed grains depend on trade policies of the U.S., the importing countries, and other exporting countries. To examine the effects of these policies, the U.S. export demand elasticity is estimated from the total import demand and the market share functions for each of four major importers of U.S. feed grains. These four countries import 50 percent of U.S. feed grain exports. The elasticities of U.S. export demand are combined with those of U.S. domestic demand and supply to derive the impacts of selected trade policies: (1) tariffs, (2) minimum-import-prices, (3) export subsidies of the U.S. and of the other major exporters, and (4) import and export restrictions on U.S. feed grain exports.

Extract: This report presents the results of a study of agricultural and forestry research programs in the United States. The report considers the essential role of agriculture in our total economy and the well-being of people at home and abroad. It evaluates our present strengths and weaknesses in agricultural research and identifies problems facing agriculture and forestry in the years ahead, the solutions to which offer great potential benefits to the public. It provides an inventory of our work in 1965. It recommends allocations of resources for agricultural research in 1972 and 1977.

 Abstract: Although U.S. agriculture in 1976 was plagued by high temperatures and dry soils for most crops, farm output rose 3 percent above the 1975 record high and inputs used increased by 1 percent. Cropland used for crops increased 2 million acres and crop production per acre equaled the 1975 level. Fertilizer use reached a new record high, rising 18 percent. Tractors and some machinery numbers declined. Hours of labor for farmwork also continued a long-term decline, decreasing 3 percent from 1975.

 Abstract: This report presents average sales, costs, and returns information for 14 wholesale ornamental container nurseries in Florida for the 1975 tax year. The nursery farm income averaged \$85,279 in 1975, while the average value of plant sales was \$216,369. The cost per square foot in production was about 66 cents in 1975 and the cost per dollar of adjusted sales (sales plus plant inventory increase) was about 89 cents. The average container nurseryman reported a net return of \$21,524 in 1975.

enterprises. Certain assumptions must be made when developing enterprise budgets. Management levels, prices received, prices paid, fertilization and cultural practices represent some of the most critical assumptions. The enterprise budgets represent what we believe to be production practices and reasonably attainable yields for commercial vegetable producers in South Carolina. The input levels in the budgets are not recommendations for a particular crop but represent the general South Carolina recommendations for fertilizer and chemical rates. Each budget contains tables of the monthly summary of returns and expenses, machinery requirements by months, machinery labor requirements by months, machinery fixed and variable costs per hour, and cost per acre and per time over for the machinery and equipment.

 Extract: The figures in this report were derived from the
 farm business records of 239 dairy farmers who participated in
 the Electronic Farm Accounts program in 1976. In addition, the
 30 Maine ELFAC records were supplemented by data contributed
 by 51 farmers who maintained their records with the AGRIFAX
 system. This gave a total of 290 dairy farm business records
 in the analysis. No attempt was made to select farms that were
 typical for the area. Enrollment in ELFAC is open, for a fee,
 to any farmer who desires to use the system for keeping and
 analyzing farm business records. Farmers participating are
 probably somewhat better than average.

Abstract: Some of the impacts of energy cost increases and reduced supplies on the product mix of annual field crops and vegetables in California are analyzed. A quadratic programming model including risk is used to evaluate the effects of increased energy costs and reductions in fertilizer and in fuel supplies. The model includes a demand matrix of some nine

field crops and twenty-eight seasonal vegetables. The study also considers the relative impact of energy changes on producer and consumer welfare. Results suggest continued viability of vegetable production but differential consumer and producer impacts associated with energy changes.

Abstract: This paper presents a comprehensive approach to analysis of the small farmer's basic economic system. Total and market supply responses are estimated considering the small farmer's income and land limitations. These two factors are hypothesized to be the main determinants of this cropping pattern. The model displays sufficient flexibility for adaptation to varied cropping patterns in different regions and countries, and utilizes cross-section data which can be obtained when time-series are non-existent.

Abstract: The authors emphasize that unless present policies are substantially changed, the forces now in motion in agriculture will continue. They point out again that a more concentrated agriculture would conform to farmers' desires for more security and less risk but would also conflict with their wishes for proprietary independence. Policy choices still remain open that would assist in maintaining some dispersion of farm production in those areas where dispersion still exists. Farm operators, input suppliers, and marketing agencies that favor traditional dispersed agriculture should focus their efforts on maintaining and encouraging such policies.

Extract: With increasing concern about socioeconomic adaptation to change and about the effects of agricultural technology, adjustments in scientific research and the activities of agricultural scientists seem inevitable. Agricultural scientists tend to be highly specialized, but assessment of the wide-ranging consequences of technology requires a coordinated, multi-faceted investigation. The focus of this paper is on strategies which can be used to establish relationships between technology assessment and scientific research.

Abstract: A farmland assessment law signed in August 1977
employs a new assessment formula based in part on the market
price of farmland and in part on two measures of gross income
from farmland. Farmland so assessed is specifically exempted
from the traditional "equilization" procedure. Questions are
raised about the effects of the law and how it is to be
administered, particularly with respect to building values and
a tendency to be regressive in valuation of poorer-land
counties. The new formula applies to the "best grade of land
in the county," with land of lesser grade assessed
proportionately lower

Abstract: In recent years, a large number of computer-based
models have been developed to help the agriculture community
analyze trends, identify problems, and evaluate policy
alternatives. Over 50 models with potential for aiding
decision makers in analyzing many policy related matters in
food and agriculture are described. These models vary by
scope, size, methodology, and issues covered. They can be
viewed as a hierarchical set of analytical tools which can be
used to address several levels of problems, such as local
issues regarding a specific crop, regional issues involving
several farm inputs, national issues integrating nutrition
with production policies, or global problems addressing
population, wealth, and food. However, they are only partial
representations of reality based on certain assumptions of
their designers.

 Abstract: The U.S. tobacco industry employs several hundred thousand workers for production, processing, and marketing. Value of tobacco sales usually ranks fourth or fifth among crops. The crop utilizes about 7 percent of total farm labor. Producers spend about \$300 million annually on production inputs and services. In 1967, more than 75,000 persons were employed in 329 tobacco manufacturing establishments. Payroll totaled \$377 million and value added by manufactures amounted to \$2 billion. Non-tobacco materials used amounted to \$387 million. Manufacturers spent \$314 million advertising cigarettes in 1970. Federal, State, and local taxes amounted to about \$4.9 billion last year. About half-a-million retail outlets sell tobacco products. Tobacco is also an important export commodity that contributes substantially to the U.S. balance of payments.

 Abstract: The Canadian dairy sector operates under a stabilization program of price supports, market quotas, and export subsidies. The stated objectives of the Canadian dairy policy are to provide producers of manufacturing milk with equitable returns for their production and to provide consumers with a steady and adequate supply of dairy products. Canada and the United States bilaterally trade dairy products, most of which are nonfat dry milk and cheese.

Abstract: Questions affecting a policy choice between a
concentrated versus dispersed farming system are not new.
Criteria for the choice begin with the ideals, values, and
goals of all who are affected--farm operators, tenants and
laborers, marketers, and consumers. The authors test the two
systems against these criteria while reminding that other,
intermediate systems also are possible. Further, any
preference for dispersed farming does not exonerate that
system from its faults or excuse it from all need to change.
Overall, purely economic factors in the policy choice are not
more important than "our ideas of the kind of world we want to
live in."

industry is linked to the New York State economy and to examine some recent trends. Also, we would like to look at the employment situation in New York State to see where changes have been taking place. We will then look at the agricultural production component and the food manufacturing component, and talk about the impact of primary agricultural production and marketing. The concept of economic-multipliers will be used to show that all jobs are not created equal. Some jobs have a greater impact on the economy than others. Lastly, we will address the question of a plan for development and growth for the food and agricultural industries within New York State.

Abstract: Agricultural production in the People's Republic
of China (PRC) in 1976 was disappointing. Total grain
production is estimated at 267 million tons--about 1 percent
below the 1975 level. U. S. agricultural exports to the PRC in
1976 were negligible, but agricultural imports from China
nearly doubled from the 1975 level. The crop outlook for 1977
in the PRC is uncertain because of unfavorable weather in
winter 1976 and spring 1977.

Abstract: Besides land, knowledge, and markets, a collection
of other influences also affect the structure and control of
agriculture. Risk and its abatement, the mystifying mixture of
income tax rules and regulations, payment limits and small
farm benefits in land retirement and direct payment programs,
pollution control methods--all these have an actual or
potential affect on the kind of farming system that will
prevail in the future. Political power and the use made of it
by rural people may be the most powerful force of all in
influencing policies that will affect capital accumulation,
the organizational structure of agriculture, and the control
of decision making.

Extract: The purpose of this study is to evaluate the
long-run impacts of the developing energy situation on
agricultural production. An earlier study shows that irrigated
farming, more than any other part of agricultural production,
is affected by changes in energy supplies and prices. Either
high energy prices or an energy shortage would reduce
production of irrigated crops. Reduction in irrigated crops
then has a "second round" effect on land use and crop
production in other regions of the nation. If agricultural
exports continue to rise, however, impacts on irrigated
agriculture are not expected to be as severe as with lower
exports. This study's objectives concentrate on the following
questions: What might be the effects of natural gas
deregulation, specifically in relation to irrigated farming?
How might the impacts of natural gas deregulation differ from
those of natural gas curtailment for irrigation? What are the
interregional and national effects of the different energy

Abstract: Economic externalities created by the use of
agricultural pesticides and implications of such externalities
on social welfare were studied. The objective was to measure
the externalities for some specified region and time period
and to incorporate them into a model which was developed to
aid in the choice of a pesticide usage policy for the area.
The choice criterion was a social welfare measure. The model
employed the concept of consumers' plus producers' surplus as
a measure of "welfare". For each of three specified policies
the model maximized this measure of welfare over production
alternatives available to the region.

Source: OTHER US Doc Type: MONOGRAPH Location: AGE
Abstract: About six percent of all agricultural employers
will be subject to the provisions of PL 94-566. These
employers hire about half of all covered agricultural workers.
A small number of employers comprised predominately of farms
with high sales volume and highly seasonal operations would
still cover in excess of half of the hired work force on these
types of farms. The likelihood of Class I farms, corporations,
crew leaders, or miscellaneous, fruit, vegetable, general and
tobacco farms to be covered is distinctly higher than for
other classes and types. The average annual contribution per
worker by an agricultural employer amounts to \$30 for the
survey area, but ranges widely among types of employers and
states. If agriculture is completely financing the costs of
the benefits received by its workers - contributions of 2-3
percent of the taxable payroll will be sufficient in most
states. Before experience rating takes effect,
non-agricultural employment stands to subsidize in some
states, the benefit payments to agricultural workers on a very
modest scale.

Abstract: The Famine Prevention and Freedom from Hunger
Amendment was added to the International Development and Food
Assistance Act of 1975 through efforts of Representative Paul
Findley of Illinois and Senator Hubert Humphrey of Minnesota.
The Amendment represents an effort to involve agricultural
scientists from U.S. land-grant universities on a long-term
basis in the agricultural research and educational programs of
developing countries. It could also have important benefits
for U.S. agricultural development.

Abstract: The year 1977 was a key point in development of
agricultural and food policy. The passage of the Food and
Agricultural Act of 1977 represents an effort by supporters of
farmers in Congress and sympathy of urban Congressmen. The
bill contains several benefits for farmers but the most costly
part in terms of government expenditures deals with food
stamps. Review and revision of our food and agricultural
policy every four to five years can be expected to continue.

Abstract: The new assessment law states that a formula will
be used in valuing the best and highest grade of land based on
average value of agricultural products sold, a three year
average value per acre of four principal crops (corn,
soybeans, wheat and all hay), and 10 percent of the sale price
of land transferred for agricultural use. Questions are raised
about how the law will be implemented and its affect upon tax
assessments and local government revenues.

Abstract: This monograph contains nine articles authored by
seventeen agricultural economists from nine land grant
universities, the U.S. Department of Agriculture and the Farm
Foundation. The objectives are to identify major policy issues
resulting from the expiration of the 4-year Agriculture and
Consumer Protection Act of 1973 and to analyze the policy
alternatives that could be included in replacement legislation
to deal with these issues. Topics covered include target
prices, deficiency payments and loan rates, acreage
allotments, production controls, special commodity programs,
disaster payments and crop insurance, export and import
controls, food reserves and food aid.

Extract: Farmlands and Wildlife Areas of Michigan can now be
preserved from nonfarm uses through property tax relief. In
May 1974, Public Act 116, the "Farmland and Open Space
Preservation Act," was passed into state law to provide this
form of protection. It covers both farmland and open space,
and provides tax relief to an owner of farmland as long as the
owner agrees to keep it in substantially undeveloped
condition. Any owner of farmland may apply for a "farmland
development rights agreement." This bulletin discusses only
the parts of Public Act 116 that pertain to agriculture.

Abstract: A wheat supply model based on regional planted and harvested acreage equations represents Part I of a two part wheat econometric framework being developed to measure the factors affecting wheat production and price (demand) levels. The major characteristics of several types of wheat acreage adjustment programs in recent years have been quantified into two broad acreage policy measures--an "effective support rate", and an "effective voluntary diversion rate". These variables along with several other economic and weather condition variables have been used to develop planted and harvested acreage equations based on the 1950 to 1970 period. The policy variables differ somewhat with respect to their impact on wheat acres planted among the major wheat growing areas, but are generally important factors affecting planted and harvested acres. Wheat market price expectations represented by the U.S. prices received by farmers the previous year also are important factors affecting wheat acres.

Abstract: Acreage supply relationships for corn in the United States are analyzed for 1948-70. Emphasis is on the effect of changes in government policies because similar programs for acreage control and price support are the most likely form of future policies. A model for empirical evaluation of loan rates, support and diversion payments, and acreage restrictions is developed and tested. More than 95 percent of the variation in U.S. corn acreage during the study period can be associated with the selected policy variables. The approach suggested in this research appears to be applicable to other crops heavily influenced by government policy.

Abstract: This report examines the probable impact of alternative U.S. sugar policy positions on U.S. sweetener producers, processors, and consumers. Policy options considered include U.S. free trade, participation in an international sugar agreement, supply management through import quotas, and direct compensatory payments. World sugar prices to 1980 are projected for the free trade option. Consumer and U.S. Treasury costs are compared for protectionist options.

Abstract: The use of projections in public and private decisions, with emphasis on agricultural decisions, is reviewed. At the public level the decisions deal with agricultural policy, program, and project problems, and at the private level with the problems encountered by farm and agri-business firm managers. There is a discussion of (1) the impact of increased competence in economics and econometrics on the use of specialized projections with respect to agriculture, and (2) the credibility gap which has arisen among decision makers with respect to all quantitative work. The reasons for this credibility gap reveal opportunities for systems scientists in modeling the domains of agrarian problems and further developing systems science techniques to (1) include "man components" and (2) close the normative feedback loops required in iteratively and interactively defining and solving problems.

Extract: Given the complex interrelationships between environment, technology, and U.S. agriculture, this study evaluates the relationships between various agricultural environmental policies and the corresponding weather-induced variation in grain production. Alternatives that will be analyzed include a restriction on nitrogen fertilizer usage, a maximum allowable per acre soil loss, a livestock waste runoff control policy, a limited restriction on organochlorine insecticides, and a measure of the effect of all four environmental policies on the overall U.S. production capacity. Each policy is analyzed to determine if the resultant changes in regional production patterns cause an increase or decrease in the expected variation in U.S. grain production. A second objective is to determine the optimum size of a grain reserve needed to offset fluctuations in grain production when the reserve is designed to meet various proportions of the domestic and foreign shortfalls in grain production.

Extract: Whether the "present rate" projection calculates 25 years or 50 years before exhaustion of energy resources, is only a matter of degree in defining the absolute necessity of dealing with economic, social and political stresses of a major transition in energy usage patterns. Therefore, this report will not engage extensively in specific data selections, citations and interpretations related to energy sources or usage details. It will address the anticipated impacts of energy related problems on the agriculture and associated enterprises of the Great Plains.

Extract: This report on multilateral assistance in agriculture describes the work of international organizations in the field of food and agriculture supported by the United States. Increased funding has been given to these organizations in recent years, and they have increased the proportion they allocate to programs in food, agriculture, and rural development. This study (an update of the earlier publication, Multilateral Assistance for Agriculture Development, ERS-521) focuses particularly on what has taken place since the World Food Conference of November 1974.

Abstract: Policy options directed at controlling the water input in agriculture were examined as methods of simultaneously solving water scarcity and farm price problems. A model farm linear programming approach was used to analyze the options for a specific geographical area. When compared to a set aside program the water control option appears to be attractive in terms of water conservation, production control and government cost.

 Abstract: The Agricultural District Law (Agriculture and
 Markets Law, Article 24-AA) is designed to encourage the
 continuance of a strong agricultural industry in the face of
 growing urban pressure and speculation. It seeks to achieve
 this goal 1) by offering farmers an opportunity to protect
 themselves from some of the rising costs and governmental
 actions usually associated with urbanization and 2) by
 providing discouragements to residential, industrial, and
 commercial development within good farm areas. The steps
 required to create a district, a summary of the provisions of
 the law, and an updated copy of the text of the law are
 included in the publication.

Abstract: Raising solids-not-fat purchase prices relative to
those of fat in the dairy support program will increase fat
consumption from what it otherwise would be and lower
solids-not-fat consumption. On a milk equivalent, fat solids
basis, CCC purchases will decline, but purchases of non-fat
dry milk will increase. For a given level of support, changing
the relationship of fat to solids-not-fat prices will not
affect production significantly and likely will have only
small effects on net program expenditures.

Abstract: During the last twenty years there has been a proliferation of production cooperatives in the agricultural sector of low income countries. This paper examines the prospects for this type of firm in light of their poor historical record. A theoretical model is presented that shows the extraction of scarcity rents is a necessary condition for survival. Several case studies examined are found to be empirically consistent with the model. It is shown that policies can be devised for the extraction of rents.

Abstract: Rice production occupies less than 1% of American harvested acreage but it is highly important to the 5 major rice producing states. Furthermore, America's rice export leadership excites Asian export competitors and needy importers. The domestic and foreign economic and political objectives, policies, and constraints influencing this development since 1920 are examined and evaluated. Protective farmer support accompanied by rapid yield increases has fostered both production inefficiencies and large surpluses for export. Today, favorable world-wide crops could bring critical price decline, leaving U.S. policy makers to choose between reducing farm supports or reviving export subsidization and dumping.

 Abstract: The major problem areas of private and Federal
 programs to protect producers from loss of income due to crop
 damage by natural disasters are identified, and policy options
 for handling these problems are developed. Options are
 evaluated on the basis of protection provided and the costs
 and benefits to farmers and taxpayers. Analysis of these
 options provides policymakers with a wide range of
 alternatives concerning the level of protection to provide
 producers. The analysis shows that the cost of these programs
 generally increases with the level of protection provided.

Abstract: Three alternatives to the current peanut-price support, acreage-allotment program are considered. A linear programming framework is used to compare the effects of these policies on geographic location of peanut production, producer and consumer surplus, treasury costs, and value of allotments. Peanut production would expand in all areas except Texas under less restrictive production constraints. The largest expansion would be in Georgia and Alabama. Some version of the target price plan is considered to be a likely compromise program.

Abstract: Recent events have sparked a debate over the effects of increased dairy imports on the U.S. dairy industry. This study attempts to estimate these impacts via an econometric model of the U.S. dairy sector. The time paths of adjustment of consumption, production, and price of specific dairy products and raw milk are estimated under three alternative levels of manufactured milk product imports. The analysis suggests that much larger than historically "normal" import levels are required to bring about a substantial impact upon the dairy industry in the longer run.

 Abstract: The main objective of this study was to develop a quarterly recursive programming model of the Japanese-North American pork industries, including the spatial and temporal aspects of the sector, for use in evaluating policy alternatives. The study outlines the structure of the Japanese pork industry and develops a five region (Eastern Canada, Western Canada, United States, Japan, Rest of the World) quadratic programming model which is able to incorporate the Japanese pork price stabilization policy that includes import quotas, a variable duty and an ad valorem duty. Supply, consumption and storage functions were estimated using data from 1963 through 1974. The validated model was used to analyze the effects of: exchange rate variations and modified Japanese domestic agricultural policies on the volume and origin of North American--Japanese pork trade.

 Abstract: Recent writings on the world food situation have left the general populace with three myths; they are: 1) that world food production is losing the race with consumption, 2) world starvation has become an existing and continuing reality, and as a result 3) triage remains the only viable policy option. In reality, the world food problem isn't as bleak as various writers would have us believe. If policies which increase economic participation by stimulating production and employment are adopted, the world food problem can be solved. Some likely candidates are price and investment policy to stimulate production, technical and financial assistance from Western countries, improved trade relations, and a crash program in generation of reliable statistics.

 Abstract: Public and private policy decisions, program planning and management, and expenditures of limited federal and state funds affect food production capacity, commodity supply-demand, resource development and use, the environment, economic development, and the world food situation. In dealing with the long-run aspects of these problems, public decision makers are increasingly turning to anticipator analysis for which they need more and better information about alternatives, tradeoffs, and impacts on social value functions. Providing private and public decision makers timely futuristic information about U.S. food and agriculture is the mission of the Economic Projections Program of the Economics, Statistics, and Cooperatives Service of USDA. Its approach is a "dual thrust man-machine simulation system" which provides futuristic information and analysis about the U.S. food and agricultural system and its major linkages with the general and world economies.

Abstract: An econometric simulation model is developed which causally relates resource use, production, price, utilization, and income for major agricultural commodities. The recursive model links related commodity subsectors and utilizes time lags and feedback information. The simulation model is used to analyze the effect of selected public policies for agriculture. The first simulation tests the model's ability to predict the historical behavior of the agricultural sector. Subsequent simulations investigate the implications of free markets, increased input prices, higher price support rates for corn, and higher price support rates for wheat on resource use, output, and income for individual commodities and United States agriculture as a whole.

Abstract: During 1963-69, growth in wages and salaries and other off-farm income improved average income levels of people with farm earnings and probably brought about more equal income distribution. Nevertheless, many of these people continued to report low incomes. More traditional farm programs may remain necessary in rural areas where the potential for growth in off-farm jobs is minimal. Abstract: This paper is divided into two parts. The first discusses 1-past trends in food output for world agriculture, 2-a set of projections for the developing-market economies for 1985, and 3-the importance of agricultural trade both to the U.S. agricultural sector and to the economy as a whole. In the second part, the author attempts to analyze the factors likely to affect U.S. market prospects for the future.

Extract: This study, made by means of a national and
interregional programming model, examines the future of
American agriculture. It examines policy alternatives and
various outcomes for agriculture if the industry took on
various structures in size and technology. In the latter
connection it measures, in relation to policies and farm sizes
which might prevail in the future, affects of farm commodity
prices, returns in the farm sector, employment and input
requirements of agriculture, capital needs of the industry,
consumer food costs and generation of employment and income in
the rural nonfarm sector. These measures are made not as
prescriptions but as trade-off comparisons which can be used
by Americans as they consider alternatives in farm and food
policy over the future decade.

Abstract: While the Food and Agriculture Act of 1977 has
much in common with previous legislation and continues the
evolution of agricultural and food policy, important changes
are made in grain reserves, food stamps, procedures for
setting target levels, support prices, acreage bases on
individual farms, as well as administration and funding of
research and education. Some consequences are evident, but
much will depend upon unpredictable events of weather and
foreign markets. The results of the Act, as compared to no
policy, are traced for consumers, producers, foreign trade,
and U.S. Treasury payments, under alternative scenarios. If
shortages return, much of the law becomes irrelevant.

Abstract: The use of formal models to evaluate public policy is increasing. Comparison of the methodology and results of various models may be facilitated by the simple classification presented in this paper. Following Tinbergen, the components of policy are designated as objectives, instruments, and performance indicators. Objectives are classified into those related to efficiency, distribution, and stability. Achievement of these general objectives is gauged by the use of performance indicators. Intervention into the system occurs by the use of instruments, singly or more often in combinations. Two points of entry into the system are considered: the product market and the factor market and in each of these markets the policy instruments may either focus on the control of quantity or the control of price. Examples are given of performance indicators and policy instruments.

Abstract: Anaerobic digestion is a biological process in which bacteria break down organic matter to produce methane, partially stabilized effluent, and other products. Although the process has been advocated as a source of fuel, feed, and fertilizer, its widespread adoption in American agriculture is doubtful. The cost and complexity of most digestive systems make them difficult to incorporate in agricultural operations. Although site specific applications may be feasible, these will not have a major impact on the agricultural sector. As a source of energy, there is little possibility of anaerobic digestion providing even a small percentage of national energy requirements.

 Extract: Nonpoint source pollution is one of several important issues affecting agriculture. Policies are being made and programs are being designed to deal with this issue. Much of the debate deals with the technical and economic aspects of various policies. The present paper deals with certain sociological aspects that may be easily overlooked but which can greatly alter the success of a program. This discussion should aid in the selection of programs, as well as help agency personnel define their roles in implementing policies.

Abstract: Yield response to fertilizers on annual crops is reviewed with reference to Brazilian fertilizer policies. Data for the 1971/72 year for four annual crops on farms in the Ribeirao Preto region is analyzed using Cobb-Douglas and quadratic functions. Limited yield response to fertilizers is found suggesting the need for additional economic and agronomic research into the issue.

Abstract: Primary research in Caruaru County, Pernambuco, in Northeast Brazil revealed that owners of small farms were assessed property taxes up to 27 times higher per hectare than owners of large farms. Small farmers also received markedly less credit and extension assistance from government agencies than large farmers. However, small farms were shown to be much more productive in the use of land and capital, to absorb more labor, and to support the segment of the population for whom welfare levels are severely depressed. Specific recommendations for making government agricultural policies more consistent with pronounced national social and economic goals were presented.

Extract: This book leads from the origins and formation of U.S. agricultural policy, to the present challenging situations. It attempts to provide a broad understanding of the major forces affecting policy, the groups seeking to influence or control it, the economic and social settings, the problems that have evolved and the solutions offered by economic analysts. The text examines the present structure of the production, input, and marketing sectors of U.S. agriculture through which policy must be exercised and shows how recent legislation has affected this structure. It explores the changing links between U.S. agriculture and trade and aid. It looks at the relationship of agriculture to poverty in both urban and rural areas. One chapter discusses the changing goals and values of farmers and other citizens, what future goals might be, and the sort of agricultural policy such goals would imply. Emphasis is on concepts and issues rather than details.

Abstract: Western Europe's agricultural output was down in 1976, largely because of a long drought. Grain production was much below the poor 1975 harvest, but higher world grain production in 1976 softened the impact of the Western European shortfall on world grain trade. European Community (EC) beef output declined slightly in 1976 and should drop again in 1977, putting an end to a surplus situation which has lasted for some years. Dairy production was up again in 1976, and surpluses will likely remain burdensome in most of Western Europe in 1977. The operation of the Common Agricultural Policy of the EC continues to require high budgetary expenditures and to pose serious impediments to the flow of U.S. agricultural exports to the EC. Largely because of drought-induced demand for feeds, U.S. farm exports to Western Europe rose 10 percent in 1976, but the increase is likely to be smaller in 1977.

Abstract: The Agriculture and Consumer Protection Act of 1973, which expires in 1977, has served as a basis for agricultural and food policy since 1974. Provisions of the act apply to crop years 1974-77. In this article, the authors first review the economic setting before and after passage of the act. This initial section provides context in which the development and operation of the act may be viewed. A key aspect relating to the operation of several provisions is the unprecedented rise in commodity prices and production expenses that occurred shortly after the act was passed. Major provisions of the 1973 act are summarized by section and title, and the impacts are assessed by commodity or program subject area. Treasury expenditures under the act are summarized in tabular form.

Abstract: The proceedings report the major topics of a national public policy conference held September 11-15, 1977, for extension workers from 46 state universities and USDA representatives. The objectives were to provide information on public issues, to explore various approaches in conducting public policy educational programs, and to share ideas and experiences. Topics covered were: Federal Policy Process, U.S. Energy Policy, World Food - U.S. Policy Choices, 1977 Food and Agriculture Legislation, and Agent Training and Leadership Development.

Abstract: Demand projections from 1965 to 1980 for
agricultural products in Denmark show that beef and poultry
meat consumption will increase, pork consumption will remain
steady, and fish will continue to be an important meat
substitute. Larger imports of fruits, vegetables, and tobacco
products may be anticipated supply projections show that
increased domestic production will account for an increase in
feed grain supplies. Total feed demand, however, is projected
to decline as a result of a projected decline in cattle and
poultry numbers and an increase in feed efficiency. While
production of bread grains will decline, output of
high-protein pulses is projected to increase. Pork production
is projected to increase; exportable supplies are projected to
rise about 25 percent. Poultry meat and egg production is
forecast to decline. Most projections assume that Denmark will
not join the European Economic Community and that the
country's present agricultural policies will continue.

Abstract: Agricultural production in El Salvador has been increasing, but at a rate slower than population. The principal export crops--coffee, cotton, and sugar--have benefited most from improved technology and from attention to marketing by cooperative organizations. Increased corn production has resulted from many years of research and extension work with local farmers. Wheat is the country's chief agricultural import. El Salvador is an important source of coffee beans and sugar for the United States, which in turn is El Salvador's prime source for wheat. Western Europe, Japan, and the Central American Common Market are important trading partners of El Salvador.

Abstract: For 1967-71, an average of 264 million acres of farmland were cultivated annually in the People's Republic of China; in the continental United States, 386 million. However, because of multiple-cropping, the sown area in China was about 371 million acres--a third more than U.S. sown area. In general, China's grain area is almost twice the U.S. grain area, but Chinese yields are only half of ours, primarily because of our greater use of technology. Grain crops for human consumption account for about 70 percent of China's grain output, compared with 23 percent of U.S. grain production. Cottonseed, sunflowerseed, and tobacco production is about the same in the two countries. China has half as many cattle but nearly three times the number of hogs and sheep--despite considerably lower levels of feed grain production. Agricultural commodities are more important in China's total trade, accounting for about 52 percent of exports and 35 percent of imports, compared with shares of about 18 and 15 percent, respectively, in the United States.

 Abstract: Multiple cropping is the practice of growing more
 than one harvested crop in sequence on the same piece of land
 in the course of one year. It is sometimes commonly known as
 double and triple cropping. While an ancient technique in many
 parts of the world, multiple cropping is of current importance
 because of the promise it holds for alleviating important
 contemporary problems in the less developed nations. It can
 help make possible increases in total agricultural output, the
 variety and quality of food, rural employment, and
 small-holder income. Recent technological advances in
 developing short-season varieties have both (1) broadened the
 area of the world where multiple cropping is possible, and (2)
 increased the potential number of crops which may be grown in
 current multiple cropping areas. But to take advantage of
 multiple cropping, adequate water control must be available
 (which generally means irrigation), along with farm chemicals
 and improved farm management. Essentially no general
 comprehensive information on multiple cropping on a global
 scale has been available. This report is an attempt to correct
 that situation.

Doc Type: MONOGRAPH Location: AGE

Abstract: Land tenure institutions are legal and contractual or customary arrangements whereby people in farming gain access to (or are denied) productive opportunities on the land. When development is defined as a process of increasing opportunities for the broad mass of the population, institutions must play an important role in determining who receives opportunities on the land and the income resulting therefrom. The author discusses five areas in which land tenure institutions influence whether a country is able to move toward these development goals: 1) income distribution and demand consequences; 2) economic and political power distribution; 3) investments in agriculture and supply consequences; 4) investments in other sectors of the economy; 5) premature farm to city migration. Development efforts which attempt to remold these institutions must work within a context which requires increased food production, sales abroad to earn foreign exchange, and a siphoning off of some of the agricultural sector's surplus to support public investment projects. Indian, Russian, and United States' experiences are examined.

Use of wheat for feed in the European Economic Community
with projections to 1975
Friend, Reed E
USDA Foreign Agr Econ Rep 74, 81p Aug 1971
A281.9 AG8F
Search: 19710800
Source: USDA Doc Type: MONOGRAPH Location: AGE
Abstract: Agricultural policies pursued by the European
Economic Community (EEC) have resulted in significant
surpluses of soft wheat. Although some wheat is fed directly
on farms, a large tonnage must be exported or denatured for
feed at a high cost. The EEC's wheat-denaturing regulations
evolved through a phase of extreme caution to one of generous
subsidization. Little information is available on farm
attitudes concerning the use of wheat for feed. Further
adjustments in the EEC's wheat/coarse grain price ratio to
better reflect relative feed values are expected. Use of wheat
for feed in the EEC is projected to range from 9.5 to 11
million metric tons in 1975. Such usage could displace from
8.5 to 14.5 million metric tons of feed grains, depending on
which feed grain is selected.

Abstract: Recent trends and developments in Pakistan's
agricultural production and trade are discussed. The two major
goals of the Pakistani Government are to attain
self-sufficiency in food and to earn sufficient foreign
exchange to maintain agricultural and industrial development.
The use of high-yielding grain varieties, along with expanded
irrigation and fertilizer use, has significantly boosted farm
output, although many technical and economic problems in
agricultural development remain unresolved. Pakistan's foreign
trade is on the increase and its flow is shifting from Western
Europe to Eastern Europe.

Abstract: Past, present, and alternative U.S. dairy programs
 have been thoroughly analyzed with respect to their potential
 for solving the U.S. dairy problems. However, implications to
 the U.S. of results of dairy programs in other countries with
 problems similar to ours, have had little analysis. Finland's
 dairy problems bear many similarities to those in the U.S. It
 too has had serious dairy pricing and income problems. An
 analysis of Finland's dairy marketing programs and policies,
 can therefore be of value in addressing the U.S. dairy
 problem. This report quantifies the effect of Finland's
 various governmental dairy programs which include: (a) "Soil
 Bank" payments to dairy farmers; (b) dairy cattle slaughter
 premiums; (c) government "target pricing" on farm milk; (d)
 "supply management" programs; (e) consumer butter subsidies;
 (f) retail price control; (g) producer milk subsidies; (h)
 milk transportation subsidies; (i) export subsidies; and (j)
 import and feeding restrictions on various dairy feeds.

Source: USDA Doc Type: MONOGRAPH Location: AGE
 Abstract: Under President Salvador Allende, Chile's land
 reform efforts are being based on formation of large farm
 cooperatives rather than the small owner-operated farms
 emphasized by the previous administration. Expropriation of
 all large privately owned farms is due to be completed in
 1972. Crop productivity may be down sharply in 1972 but the
 causes cannot be clearly identified with changes introduced by
 the current government. Cattle stock numbers have decreased
 precipitously since late 1970. The U.S. share of the growing
 Chilean market for foreign agricultural commodities has
 decreased, as has the value of U.S. agricultural exports to
 Chile.

Source: USDA Doc Type: MONOGRAPH Location: AGE
Abstract: Brazil increased agricultural output about 4.5
percent a year from 1947 to 1965, mainly by expanding the
cultivated area, but it has the potential to double the area
cultivated. Agricultural production grew more rapidly than
population in the 1950's and 1960's, but crop yields remained
low and traditional practices were followed with low levels of
fertilization. Human labor is the only source of power on
three-fourths of the farms. Agricultural output increased
rapidly enough to meet rising demands for farm products
resulting from population and income growth and to permit some
exports. Agriculture has remained the principal economic
activity and source of foreign exchange earnings in Brazil
with coffee being the major export. The agricultural labor
force rose about 2 percent a year, and output per farmworker
rose almost as fast.

Source: USDA Doc Type: MONOGRAPH Location: AGE
Abstract: During 1940-65, Mexico's agricultural output grew
4.6 percent a year while population rose 3.3 percent. The
rapid expansion of agricultural production was primarily due
to increased use of purchased inputs (including fertilizer and
better seed varieties), land, livestock capital, and hired
labor, all of which were about equal in importance. Output per
worker increased about 3 percent a year. Two Government
programs--land reform and irrigation development--contributed
to productivity increases. By 1965, public irrigation had
affected over 2 million hectares of farmland. Inputs used on
this land were those associated with modern agriculture, but
such inputs were of little significance on most of the land
outside irrigated regions. Under the land reform program, land
was expropriated from large farms and distributed to 2.3
million previously landless Mexicans. By 1965, land reform had
affected 29 percent of the arable land and 43 percent of the
cropland.

Abstract: Iran's economy is growing rapidly, exceeding 14 percent in both 1971/72 and 1972/73. Increasing oil production dominates export revenue. Agriculture's share of GNP continues to decline but it still employs the largest share of the labor force. Agricultural exports comprise about 7 percent of total exports and consist mainly of cotton, fruits and nuts, and hides and skins. Major agricultural imports are cereals, especially wheat, fats and oils, sugar, tea, and dairy products. Wheat is the most important food grain. Production fluctuates substantially from year to year depending on the weather and Iran may be either self-sufficient or in need of imports. On occasion, wheat has even been exported. The growth of the livestock sector has been slow, due mainly to severe winters and lack of feed. The land reform program, begun in 1962, is now substantially completed and is expected to stimulate agricultural development. Expanded irrigation facilities and increased productivity are major goals of agricultural development. In addition, efforts are being made to improve Iran's marketing and distribution systems.

Abstract: Structural changes in West German agriculture in the past two decades and the role of Government programs in bringing about these changes are discussed. These changes include those related to the agricultural labor force, farm size and farming structure, land tenure and consolidation, part-time farming, and marketing systems. The report compares West German agriculture with that of other European Community countries. Other subjects include trends in farm productivity and income and public expenditures for agriculture. The outlook for West German agriculture for the rest of the decade of the seventies is also discussed.

Jordan's agricultural economy in brief

Kurtzig, Michael E

USDA Econ Res Serv ERS Foreign 326, 11p Jan 1972

A281.9 AG83

Search: 19720100

Source: USDA Doc Type: MONOGRAPH Location: AGE

Abstract: The economy of Jordan is beginning to show signs of recovery from the paralysis brought on by the mid-1970 internal strife and the September civil war. These disorders were a consequence of the June 1967 war with Israel which dealt a severe blow to Jordan's economy--the loss of the West Bank containing 40 percent of the country's agricultural land and production. Production of the main grains--wheat and barley--fluctuates widely, primarily because of weather. Wheat must be imported to meet domestic needs. Exports are mostly fresh fruits and vegetables. The balance of payments is supplemented by "invisibles" such as money received from Jordanian workers in other countries. Development plans call for greater expansion of irrigation schemes, use of new seed varieties, and improvement of farming methods.

 Abstract: Problems and accomplishments of the Spanish
 agricultural economy in the 1960's are discussed as well as
 aspects of agricultural policy that influence changes in the
 agricultural sector. The structure of agricultural production
 is described. Plans and prospects for attaining goals and
 solutions to problems are also discussed.

 Abstract: A pilot Intensive Agricultural Development
 Program, popularly known as IADP, or Package Program, was
 undertaken by India in cooperation with the Ford Foundation in
 1950. It was designed for participation by all farmers in
 selected districts. Assistance in adoption of a locally
 adapted "package" of improved technology was to be combined
 with adequate supplies of fertilizer and other inputs, credit
 to buy them, and assurance of remunerative prices. The program
 was only partially implemented and many unforeseen problems
 were encountered, but considerable progress was made before
 the advent of higher yielding seeds. The program has led in
 adoption of new research results, including the new seeds.

Abstract: Recipients of land on perhaps as many as 50 percent of the agrarian reform settlements will not be able to pay all the debts established by the 1967 agrarian reform legislation. Policy alternatives include transferring workers from over to under populated farms, expanding output through improved management and increased investment, reducing the level of payments made to farm labor, scaling down debt obligations and adopting a new form of land distribution and operation. Linear programming optimum solutions for six typical farming situations showed that improved management would increase output, operating capital requirements and debt repayment capacity but labor use would not equal present levels. Data on six settlements and private farms for 1966-67 and 1967-68 were used in the analysis.

Search: 19710200

Source: USDA Doc Type: MONOGRAPH Location: AGE

Abstract: From 1947 to 1967, the agricultural output of Greece grew at a compound annual rate of 4.9 percent, meeting the needs of increased population and rising levels of living, accomplishing import substitution, and increasing exports. With little opportunity to expand agricultural land, Greece achieved most of the growth from intensification. The proportion of capital to all inputs increased from 19.5 to 38.3 percent, and the proportion of cropland irrigated, from 7 to almost 17 percent. Improved technology was developed and widely disseminated. A favorable economic environment was provided by price supports, bonuses, and subsidies, which -- together with investment support -- involved substantial capital and income transfers from the general economy. Massive external assistance through 1952, and at reduced levels until 1965, was a major factor in growth of the Greek economy. Labor productivity in agriculture was low, as reflected by the proportion of gross domestic product originating in the agricultural sector, yet the rest of the economy was not able to provide alternative economic opportunity.

Japanese overseas aid and investments--their potential
effects on world and U.S. farm exports

Pike, Clarence E

USDA Foreign Agr Econ Rep 81, 57 p Jun 1972

A281.9 AG8F

Search: 19720600

Source: USDA Doc Type: MONOGRAPH Location: AGE

Abstract: To diversify sources of agricultural imports,
Japan has been promoting production-for-export ventures in
foreign countries. By 1980, these projects will have generated
increases on the world market of millions of tons of feed
grains and oilseeds, and several hundred thousand tons of
cotton. These products will compete directly with those of the
United States, Japan's leading supplier in 1970. Japanese
foreign aid is projected to expand rapidly. The total for
Japanese overseas investments is officially projected to
expand from \$3.6 billion in 1971 to \$10 billion in 1975 and to
\$25 billion in 1980. Most expenditures will be directed to
oil, gas, mineral, and timber extraction ventures, to increase
supplies of the raw materials required by Japan's rapidly
expanding industries. Significant investments will be made for
production-for-export programs and in infrastructure projects
that will contribute to farm product exports. Japanese imports
of these products will make it increasingly difficult for the
United States to maintain its recent share of the market.

Source: USDA Doc Type: MONOGRAPH Location: AGE

Abstract: Sustained economic growth is modernizing Danish
food marketing. This development offers U.S. exporters many
opportunities and challenges to expand U.S. agricultural
exports--\$293 million in 1969--in the years ahead. The Danish
retail food market may grow 22 percent in the 1970-79 decade
and sales of convenience foods will increase much faster. The
increasingly affluent Danes are upgrading their diets.
Supermarkets are replacing small foodstores. Denmark had
38,155 foodstores, most of them small, in 1958 but only 28,000
in 1970. By 1980, there may be only 13,000. Nearly all will be
larger self-service stores. About 12.5 percent will be
supermarkets, compared with 2.5 percent in 1970, but they will
make the major share of retail food sales. Also by 1980, only
10 to 12 big retailing organizations may control 75 to 80
percent of Denmark's food trade. Equally rapid and drastic
structural changes are going on in Danish food wholesaling and
manufacturing.

Abstract: Traditionally a one-crop economy based on exports of rice, Thailand has achieved a remarkable degree of crop diversification, while continuing to expand rice production. Livestock raising is far less important than crop production. The world's second largest exporter of rice, Thailand has also become a major exporter of feed--mostly corn, but also cassava preparations--rubber, hard fiber, and castor seed. The country has long-term potential for further expansion of foreign sales of corn and for becoming an important exporter of soybeans and possibly sorghum. With U.S. and other aid, the Thai Government is endeavoring to further expand and diversify farm production and bring the poorer farming regions closer to the economic level of the area near Bangkok, one of Asia's richest and most productive regions. Continued growth of agriculture is essential to Thailand's development, since farming remains the basis of the country's economy, although important progress has been made in other sectors.

Abstract: The conservation, urban-industrial impact, diffusion and high payoff input models of agricultural development represent incomplete models of the agricultural development process. An induced development model is presented in which technical and institutional changes are treated as endogenous rather than exogenous to the development process. The model is illustrated from the agricultural development

Abstract: Nigeria, the most populous country in Africa, has an economy based on production of raw materials, chiefly agricultural commodities and petroleum. Important agricultural exports include cocoa, peanuts, palm kernels, rubber, cotton, and hides and skins. Production of large quantities of yams, cassava, cocoyams, sorghum, millet, plantains and bananas, corn, edible cowpeas, palm oil, kolanuts, and other crop and livestock products enable the country to be largely self-sufficient for food. Major food imports include wheat, milk and cream, and sugar. Agricultural imports from the United States include wheat, and flour, dried milk and cream, cereal preparations, and tobacco.

Abstract: Since 1960, expansion of cash crops for export has been significant in Kenya's economic growth. Important agricultural exports include coffee, tea, pyrethrum, fruits and vegetables, meat and meat preparations, and sisal. Production of substantial quantities of corn, wheat, sorghum, millet, vegetables, other crops, and livestock products enables the country to be largely self-sufficient with respect to food. Major food imports include vegetable oils, sugar, tobacco, fruits and vegetables, cereals and cereal preparations, dairy products, and animal oils and fats. Agricultural imports from the United States include nonfat dry milk, corn, wheat, tobacco, tallow, and miscellaneous foods. With external assistance, Kenya has instituted economic development plans and projects aimed at developing the agricultural and agribusiness sectors through introduction of improved seeds, product diversification, expansion of irrigation, and improvement of marketing facilities and infrastructure.

Source: USDA Doc Type: MONOGRAPH Location: AGE
Abstract: Agricultural production, the basis of Guatemala's economy, increased during the past 15 years and is expected to continue to rise in the next decade. The principal export crops--coffee, cotton, sugar, and bananas--are grown on large holdings and have benefited the most from improved growing and marketing techniques. Corn is the principal subsistence crop and wheat is the most important agricultural import. Both crop and livestock output can be expanded, but their rapid growth is handicapped by the low level of education of many farmers, unimproved agricultural technology on numerous farms, inadequate farm credit, and political and social problems. The United States and Guatemala are politically and economically important to each other. The United States is the first market for Guatemala's exports, but its share in total export value is declining as members of the Central American Common Market take a greater quantity of Guatemala's commodities.

Doc Type: MONOGRAPH Location: AGE

Abstract: Fitting production functions has become little more than a quantitative exercise for economists. They have been computed for virtually every phase of the real economy with a considerable degree of accuracy. One of the areas that has continued to present some difficulties in this regard is agriculture. The difficulties have been of such magnitude in the United States that an accepted technique has been to proceed directly to the supply function. The authors suggest that the above procedure need not be followed in the Canadian case. They fit a five variable linear multiple regression relation to Canadian agriculture which fits the industry quite well in terms of explained variation and adherence to the assumption of the analysis. This is substantially in contrast with the U.S. experience indicating a substantial difference in either data, the agricultural industries, or both. An aggregate production function of use for policy formulation purposes has been made available for the Canadian case.

Abstract: Most countries of the Far East and Oceania estimated significant gains in GNP for 1970. Farm production was up in all countries except in Japan, Korea, Cambodia, and New Zealand. Most gains can be attributed to the increased use of modern technology, particularly more fertilizer, high-yielding seeds, and irrigation. If average weather prevails, total farm production is likely to rise again in 1971 in all developing countries except possibly those of Indo-China. Programs to restrict rice production in Japan and wheat in Australia will keep the total outturn for the developed countries near the 1970 level. Reflecting an upgrading of the average diet, the market for imported farm products is expanding and diversifying. U.S. Exports of agricultural commodities to the region reached a record \$2.5 billion in 1970. U.S. Exports to Japan topped \$1 billion. Nevertheless, the United States faces increased competition for Far East markets, most notably from Australia and Western Europe

Abstract: Agricultural output in Western Europe continued at
a high level in 1971. Red meat output increased, milk output
was constant, and grain output reached a new record. Record
grain crops in the EC in 1971 resulted in another disposal
problem. U.S. agricultural exports to Western Europe increased
in 1970/71. Commodity categories which increased in importance
were oilseeds, wheat and flour, protein meals, tobacco, and
fruits and vegetables. EC enlargement negotiations were
completed in January 1972, when the United Kingdom, Ireland,
Denmark, and Norway signed the treaties for accession. A
monetary crisis has continued in Western Europe, where there
are now 4 price zones. The "devaluation" of the U.S. dollar
may have a positive effect on some U.S. agricultural exports
to Western Europe.

Abstract: Agricultural output in Western Europe continued at
a high level in 1970. Grain output declined while livestock
production increased. Wheat and milk surpluses were reduced.
Western Europe's agricultural imports, including those from
the United States, increased. Imports of U.S. protein feeds
are likely to increase in 1971. Negotiations between the
United Kingdom, Denmark, Norway, and Ireland and EC are
underway, and the Marshall plan to improve the structure of EC
agriculture is discussed. The United Kingdom is in the process
of changing its agricultural price support policy to a
variable levy system.

Abstract: Agricultural output in Western Europe hit a new high in 1973, led by a record grain crop. Red meat production was up from the low level of 1972, but still below 1971. Pork, poultry meat and milk production set new records. Further increases in livestock and crop production are expected in 1974. Prices of most agricultural products rose in Western Europe but not as much as surging world prices. The value of agricultural trade increased sharply, mostly due to higher commodity prices; U.S. agricultural exports to Western Europe rose by 67 percent to \$5.6 billion. The West European economy continued strong but was much troubled by inflation. As a result of the energy crisis, a low rate of economic growth is expected in 1974 along with severe inflationary and balance of payments problems. The European Community and other governments increased price supports and other aids to farmers in 1973. Major decisions are pending on agricultural and trade policy.

Abstract: Agricultural output in Western Europe continued at a high level in 1972. Grain output reached a new record, but red meat output declined as cattle herds were built up. Milk production increased, resulting in butter surpluses. U.S. agricultural exports to Western Europe grew in 1972. The recent enlargement of the European Community will adversely affect some U.S. agricultural exports. Inflation and a new currency crisis are major factors affecting the West European outlook. The structure of European agriculture's being modernized, but the pace is very gradual.

Abstract: Soviet 1973 agricultural production increased sharply compared with the disappointing 1972 level. Unusually good weather resulted in record or near-record crops. Livestock gains were modest but should increase more rapidly in 1974, compared with 1973, crop production in 1974 is expected to be off somewhat unless weather again is unusually good. Soviet grain and oilseed import requirements are down sharply because of good 1973 crops.

Doc Type: MONOGRAPH Location: AGE

Abstract: The generalized system simulation approach can improve information input to the decisionmaking process in general. This paper illustrates a particular application to problems of planning and policy making for agricultural sector development. An overview of a simulation model of the Nigerian economy is given, and results of a series of 15 Nigerian agricultural development policy simulation experiments are analyzed in detail. The main conclusion is that, at least for these 15 experiments, a technological transformation of agricultural export crop production is necessary for sustained economic growth. The paper concludes with a discussion of the approach's general applicability.

Abstract: Red River Valley agriculture was described and optimum farm organization for three case study farms, somewhat typical of the Red River Valley. Three sub-areas, north, central and south were delineated. Dominant land use in the northern area is chiefly small grains and summer fallow with smaller amounts of potatoes and sugar beets. In the central area, the dominant land use is small grain, soybeans and summer fallow. Corn, soybeans and small grains are dominant in the southern part. Results of profit maximizing organization indicate that expansion of both livestock and the specialty crops of sunflowers and pinto beans have potential to increase farm income in the Red River Valley. The hog enterprise consistently come into the profit maximizing organization. The specialty crops tended to increase income the most in the north.

Abstract: Three farming areas within the North Dakota's Red River Valley are delineated and the organization of farms within each is described. A profit-maximizing organization was determined for a case study farm in each area. Results of the case farm organization indicate that an expansion of both livestock and the specialty crops of sunflowers and pinto beans have a potential to increase net farm income. A hog farrow and finish enterprise is the dominant type of livestock to come into profit-maximizing organizations. Profit-maximizing plans are presented assuming both participation and nonparticipation in the government wheat program. Plans without livestock and specialty crops are also presented. The average size of farm in the area is 670 acres. Fifty-seven percent of the farms produce no livestock for sale.

 Abstract: This brief chapter brings together the highlights
 of previous chapters. The authors emphasize that unless
 present policies are substantially changed, the forces now in
 motion in agriculture will continue. They point out again that
 a more concentrated agriculture would conform to farmers'
 desires for more security and less risk but would also
 conflict with their wishes for proprietary independence.
 Policy choices still remain open that would assist in
 maintaining some dispersion of farm production in those areas
 where dispersion still exists. Farm operators, input
 suppliers, and marketing agencies that favor traditional
 dispersed agriculture should focus their efforts on
 maintaining and encouraging such policies.

 Abstract: This article contrasts post-war trends in labor
 productivity in Canada and the U.S. Global comparisons
 indicate net and gross values of production per Canadian farm
 worker to be 25 and 35 percent, respectively, below comparable
 U.S. figures. Canadian labour productivity in agriculture also
 appears to lag that in the U.S. by 7-10 years. Comparisons
 are also drawn concerning grain yields and livestock output
 technology. Implications are drawn for farm incomes and for
 agricultural research, and reference made to the relative void
 in private industry research in Canada.

Abstract: The purpose of this study was to utilize a case farm approach to estimate economic outcomes of different estate transfer alternatives. The analysis demonstrated a need for financial planning to reduce cost of estate transfers due to death. It was necessitated by the fact that a high percentage of farmers are over 55, farm values are increasing and the illiquid asset land, the dominant asset in the farmers' financial structure, is appreciating. Decision factors for the retiring farmers, such as management objectives, planning horizons, planning environment, risk and liquidity, alternatives in estate management and transfer cost are discussed. The evaluation indicated that through alternatives in estate transfer, such as trust and gifts (taxable and non-taxable), transfer costs could be reduced and beneficial results yielded. There are six tables and eight case studies.

Abstract: The stated purpose of this paper is to consider the dimensions of the machinery market in Texas, inventory some of the merits and demerits of machinery financing alternatives in the light of current economic conditions, consider in some detail the farmer's financial incentives of each financing choice, and stimulate thinking about implications for bank financing. It discusses financial lease, operating lease, custom hiring, cash purchase, and debt purchase as economically rational methods of analysis to reach machinery financing decisions. While noting that machinery services market is dynamic and unstable from year to year, it says bankers may be challenged by competitive sources of

Source: EXP STN Doc Type: MONOGRAPH Location: AGE

Abstract: The report summarizes findings of a feasibility study of a cooperatively owned large-scale hog farrowing system in North Dakota. The initial investment required to establish a 660-sow farrowing unit producing 1,000 feeder pigs per month is \$227,244 annually. Feed expenses alone constitute approximately two-thirds of the short-term operating expense. The average break-even prices for the farrowing system range from \$17.12 to \$29.73, depending upon the financial arrangements and feed price levels considered. It is concluded that the operation of a large-scale hog farrowing system is feasible in North Dakota.

Extract: This report centers on regular or "career" farm workers. Career farm workers as used here are those employees on farms who are in year-round jobs and consider farm work as their vocation. Because relatively little is currently known about career farm workers, two pilot studies were made in the summers of 1971 and 1972 to learn a few things about New York career farm workers. Some of the findings from these studies are presented in this publication. Hopefully, these findings will be of use to extension and research personnel in developing programs that will help meet the needs of career farm workers.

Abstract: Risk averse farmers in southern Minnesota should plan their corn and soybean production so that bottlenecks in field operations are least likely to occur at planting time. Because additional spring field time for these conservative farmers can be worth almost six times as much as additional fall field time, their machinery systems should be planned for large planting capacity. Risk takers on the other hand should plan their machinery systems so that spring and fall field capacities are about equal. The purpose of this study was to build a farm planning model including data on time available for field work and on yield losses associated with untimely field operations. Because the amount of time suitable for field work is a random variable, a chance-constrained mathematical programming model was developed to handle field work as a random variable.

Abstract: Farmers receive high returns from pest control, and as a result farm use of pesticides has been rapidly increasing in the past two decades. At the same time, costs not reflected in the market system that are linked with pest control are becoming increasingly apparent. The long run demand for and supply of pest control services depends upon rates of biological capital depletion and rates of pest control discovery. The relative attractiveness of alternatives to pesticides depends upon the ease with which these production changes can be made and the relative costs of the substitutes. Substitutes that appear to be attractive are insurance, management systems, more land, and nonpesticide controls such as microbials, resistant crops and biological controls. Consumer diets, and production location may change with full accounting of pest control costs. Policies which may help to reflect all pest control costs might include tax changes, subsidies regulations or property right changes.

Factors contributing to expansion of grade A milk production in Georgia

Carley, D H

Ga Agr Exp Sta Res Bull 121, 49 p Jan 1973

S51.E2

Search: 19730100

Source: EXP STN Doc Type: MONOGRAPH Location: AGE

Abstract: Milk production in Georgia in 1971 was 20 percent more than in 1966. The adoption of a federal order, supply control by producer cooperatives, increasing prices, and market certainty contributed to market expansion. Increased production per cow by improved feeding along with increased mechanization were factors also. Production expansion alternatives show that expansion by the route of higher production per cow was cost reducing whereas expansion by herd size increases alone did not reduce unit costs of production. Income from milk production was estimated on the basis that dairymen would be selling milk under the Class I base plan. Production expansion by increasing production per cow would be profitable even at the excess price of milk. Expansion of herd size may be expected at the excess price, but the higher base price would be needed to make expansion profitable over the longer run. The study shows that Class I base will acquire a negotiable value but it may be quite different among producers depending on their cost situation, production level, herd size and resource mix.

Abstract: Questions affecting a policy choice between a concentrated versus dispersed farming system are not new. Criteria for the choice begin with the ideals, values, and goals of all who are affected--farm operators, tenants and laborers, marketers, and consumers. The authors test the two systems against these criteria while reminding that other, intermediate systems also are possible. Further, any preference for dispersed farming does not exonerate that system from its faults or excuse it from all need to change. Overall, purely economic factors in the policy choice are not more important than "our ideas of the kind of world we want to live in."

Abstract: The objective of this report was to describe changes in the structure and organization of flue-cured tobacco farms which occurred following replacement of the acreage control program with an acreage-poundage program. Farmer survey data from Census Subregion 17 for 1964 and 1967 were analyzed. An average farm, constructed from the data, was used to compare the organization of farms under the two control programs. In addition, five farm sizes were delineated based on acreage of cropland in 1964 and 1967 so that changes in farm organization for farms with different resource situations could be estimated. Only minor changes in tobacco practices occurred following the change in Government programs from acreage to acreage-poundage controls. Tobacco varieties were changed, plant population per acre and fertilization levels were reduced slightly, but use of most technical innovations such as new chemicals remained constant.

Abstract: Multiperiod linear programming and computer simulation techniques are integrated into a single recursive-sequential model of the farm firm growth process. The model is tied to dynamic theories of the firm's planning behavior first developed by Hicks and more recently by Modigliani and Cohen. A central Kentucky beef farm empirically illustrates predictive features of the model. Three alternative been production management strategies are compared to demonstrate the model's potential for explaining and predicting alternative farm firm growth processes.

Abstract In 1968, some 13,300 farming corporations accounted for 1 percent of all commercial farms and operated 7 percent of the farmland. California and Florida had about one-fifth of the total number and some of the largest corporate farming operations. Nearly two-thirds of farming corporations were family owned and controlled. Since farming corporations tend to be closely held, the owners were usually involved in management. However, only one-third of the 12 average employees were either stockholders or stockholder relatives. Farming was the only business activity for the two-thirds of the corporations. Others had farm-related business and nonfarm-related business. The farm product sales of corporations was about \$3.3 billion or 8 percent of total sales from all farms in 1967.

 Abstract: The major purposes of this study were two-fold. The first objective was to determine the effects of various cow-cropland ratios, milk and feed prices, and levels of milk production on dairy income. The second objective was to compare the profitability of "drylot" vs conventional dairying in western North Carolina. Farm situations were analyzed for a conventional farm system with 52 cows on 94 acres of cropland and for 94 and 141 cows on the same crop acreage. A 150 cow drylot situation in which all feed inputs were purchased was also analyzed. The results suggest that high forage yields and milk production per cow are keys to high net returns on conventional dairy farms. For example, an increase in milk sales from 13,000 to 17,000 pounds per cow resulted in an increase in net income of \$225 per cow (at a milk price of \$7.03 per hundredweight). The drylot situation did not compare favorably with the conventional system until milk production per cow reached 17,000 pounds.

 Abstract: Besides land, knowledge, and markets, a collection
 of other influences also affect the structure and control of
 agriculture. Risk and its abatement, the mystifying mixture of
 income tax rules and regulation, payment limits and small farm
 benefits in land retirement and direct payment programs,
 pollution control methods--all these have an actual or
 potential effect on the kind of farming system that will
 prevail in the future. Political power and the use made of it
 by rural people may be the most powerful force of all in
 influencing policies that will affect capital accumulation,
 the organizational structure of agriculture, and the control
 of decision making. Although the tally of farm area
 Congressmen is down, the critically important urban vote is
 generally sympathetic to the problems of rural areas related
 to rural poverty and unemployment.

Abstract: Farm production inputs have limited value without the knowledge of how to use them. From the early agricultural societies and fairs to today's universities, experiment stations, extension services, and market information activities, public policy has been aimed to make knowledge equally accessible to all farmers. Likewise, policies to keep input supply markets competitive and to foster both supply and credit cooperatives have been intended to help all farmers. Lessened public support for these activities, the authors emphasize, would give an advantage to larger farms and lead to more concentrated agriculture. Some present trends, such as financing through contracts, partnerships or corporations, already indicate a trend to more concentration. Yet, minimum-wage laws and other policies affecting hired farm labor could work to the benefit of a more dispersed agriculture.

Abstract: An economic analysis of prospective adjustments to a declining supply of irrigation water in the High Plains indicates that a substantial increase in farm size will not necessarily offset the loss in individual farm income and land values accompanying a shift from irrigated to dryland farming. Multiperiod linear programming models were used to evaluate adjustment prospects in 12 resource use situations. The results indicate that economically feasible adjustments are closely associated with the ability to generate substantial amounts of internal capital. The ability to generate capital internally is in turn contingent on the adequacy of the farm's irrigation water supply. Less than 30 percent of the study area has a water supply sufficient for adjusting from irrigated to dryland farming without a sacrifice in living standards or net worth.

Abstract: A survey of South Central Plains farmers was conducted in 1970 to obtain farm operators' rankings of eight economically oriented goals and to determine the effect of operator and firm characteristics on the ranking of those goals. The paired-comparison technique was utilized to determine the hierarchy of goals for each respondent. The scalar values of each goal were then used as dependent variables in regression equations. About 40 to 50 percent of the variation in the goal structure was explained by farm operator and farm firm characteristics. Some factors found to be most important in explaining differences in the ranking of goals were the operator's age, educational level, farming experience, number of dependents, level of assets, off-farm income, cropland acres and net worth. The predictive ability of the equations was evaluated by applying the regression equations to additional observations not included in the randomly sampled control group. About 17 percent of the predicted hierarchies were found to be insignificantly different from the actual hierarchies.

Abstract: This publication describes the operation of typical Class I base plans and gives the rationale for their existence. General factors affecting the value of negotiable milk bases are discussed, since returns to investments in milk base may accrue over a lengthy time span, a discounted present value approach is presented as a means of evaluating the economics of milk base sale and purchase. Means of accounting for several specific factors which may affect base value in any given situation are shown. Current base provisions in Virginia are highlighted with emphasis on negotiability aspects and value. Four examples are shown of how producers under various market and production situations can calculate the value of base by using an annuity table.

Abstract: This report examines the incentives and consequences of investment by farmers and nonfarmers in commercial beef breeding herds. It investigates the profitability of investment in beef cow herds with and without the special tax provisions of capital gains, net operating loss carryover, income averaging, and offsetting nonfarm incomes with farm losses. A computer simulator was used to budget the operations over a 15-year period using several levels of product and input prices. Results indicated that there is no economic incentive for nonfarm investments in commercial beef cow herds through management companies without the special provisions of capital gains and offsetting nonfarm income with farm losses. Even with current provisions of the tax law, nonfarm investment in beef cow herds is not profitable unless the investor is at or above the 50 percent tax bracket. Implications for various sectors of society as a result of nonfarm investment in beef breeding herds are discussed.

 Abstract: Costs of manure disposal were estimated for a
 100-cow dairy herd with the four most used systems of disposal
 in Tennessee--lagoon, liquid, conventional, and irrigation.
 The initial investment requirements per cow were \$21.86 for
 the conventional system, \$60.50 for the liquid with 15 days
 storage, \$77.15 for the irrigation system, \$86.00 for the
 liquid with 30 days storage, \$97.59 for the lagoon, and
 \$111.50, \$137.00, \$162.50, and \$188.00 for the liquid systems
 with 45, 60, 75, and 90 days storage. The annual costs per cow
 were estimated as \$9.54 for the conventional, \$14.11 and
 \$16.15 for the liquid systems with 15 or 30 days storage,
 \$17.82 for the lagoon, \$18.19 for the liquid with 45 days
 storage, \$18.42 for the irrigation system, and \$20.33, \$22.27,
 and \$24.31 for the liquid systems with 60, 75, and 90 days
 storage. The labor requirements for the lagoon system were
 lowest since no labor was required beyond scraping. The labor
 requirements for the other three systems were essentially the
 same with no really significant differences in the

Abstract: An accepted theory of farm firm behavior was incorporated into an abstract computerized simulation model to evaluate the returns and risks involved to Pennsylvania dairy farm firms expanding at different levels of equity. In addition, management efficiency was treated as a parameter to test for interaction of the policies and situations with this characteristic. The base of the analysis was a dairy farm situation having crop yields and production levels approximating that of an efficient Central Pennsylvania farm. The variations and trends in yield, production, and price were intended to approximate those experienced by Pennsylvania farmers during the previous ten years. Under the given environmental and economic assumptions, the results of this study strongly indicated that the payoff for taking the risk of thinning equity below present conventional levels during farm expansion is quite high in most situations.

Abstract: The purpose of the study was to assess some alternative organizations available to smaller commercial Pennsylvania farmers who are getting out of the milk production business. Two dairy-beef production systems, dairy

replacement heifers, beef finishing, and cash crops were alternatives evaluated on two farms representing different levels of land productivity. Two levels of labor were studied: 1) a full-time operator with limited family help and 2) a farm operator in semiretirement or working about half-time off the farm. A high level of management ability was assumed. The planning horizon was of sufficient length to allow remodeling of existing buildings and the replacement of all machinery. None of the organizations studied gave returns as large as could be obtained from dairying if similar levels of management were used. For a full-time operator with some family help in caring for young calves, dairy steers and heifers were the most profitable. Beef finishing, which uses less labor, became competitive when the labor supply was reduced.

Abstract: Optimum farm organizations were derived for
parttime farmers on small farms in the Georgia Piedmont
through use of budgeting and mixed-integer linear programming.
Two levels each of family labor and of land suitable for row
crops were used for four resource situations. Two price and
cost levels were used in the analysis. The first level was
based on estimated 1969 costs and average prices of an earlier
study. The second level was based on average Georgia farm
product prices for 1972 and on adjustment of 1969 costs upward
by means of price indices. Optimum organizations under 1969
prices and costs indicated that hogs should be a basic farmer
enterprise with hay and row crops as supplementary
enterprises. Labor restricted operations seasonally. Optimum
organizations under 1972 prices and costs indicated that
soybean production should be a basic enterprise with hogs,
sweet corn, cattle, wheat, and/or a double-cropping (soybeans
and wheat) enterprise also used. Late winter and early summer
labor restricted farming operations as did the amount of
cropland.

Abstract: In the commercial sector of Great Plains
agriculture, the magnitude of individual farm capital
requirements is large and increasing. The source of capital
has changed from an internal generation of profits to debt
capital supplied largely by commercial banks, Production
Credit Associations, Federal Land Banks, insurance companies,
and individuals. Emerging problems include a demand for
loanable funds that is increasing faster than general rural
economic activity, a farm interest rate often below
competitive rates paid by urban borrowers, and for the smaller
commercial unit banks, an increase in size of loans requested
at a faster pace than the banks ability to make larger loans.
Farms are generating steadily less equity capital in
proportion to total capital needs. Problems also arise because
of the traditional forms of organization, and difficulties
with inter-generation transfer of assets.

Doc Type: MONOGRAPH Location: AGE
Abstract: This article characterized United States
agriculture over the past two decades in terms of 1) declining
farm numbers 2) larger size of farms 3) moderate increase in
output 4) changing technology. All these changes have caused
an increase in the financing requirements for farmers.
Agriculture should be viewed as composition of various
distinct groups rather than as a single industry. These groups
can be classified by commodity group, commercial orientation,
market relationships or legal form depending on the objective
involved. Projection of past trends indicate there will be
only 138,000 farmers by 1980. However. Several conditions will
tend to keep this change from occurring. A number of
less-than-large-scale farms are likely to continue production
because: 1) they do not wish to become large-scale, or 2) they
will accept less profit, or 3) off-farm incomes allows them to
be part-time farmers. However, the trend will be strongly
toward large-scale and fewer farmers operated by competent and
financially sophisticated managers.

 Abstract: Purpose of this report is to furnish technical
 information useful to farm managers, extension workers,
 lending agencies, and others concerned with agricultural
 production in north and west Florida. These budgets refer
 mainly to small farmers using 2-row equipment and in the
 \$2000-9000 net income bracket. Prices and yields relate to
 1971 and 1972. The crop and livestock budgets presented were
 developed for use in a linear programming study of minimum
 resource requirements for specified income levels, and provide
 information on (1) costs, (2) returns, (3) monthly labor
 requirements, and (4) annual labor, power and machinery
 requirements. Crop enterprises included are: peanuts,
 flue-cured tobacco, soybeans, oats for grain, wheat (without
 grazing), corn for grain, corn for silage, coastal
 bermudagrass, bahiagrass pasture, and oats (pasture).
 Livestock enterprises included are: hogs (8 sow-2 litter
 system), hogs (finishing on concrete floor), beef (cow-calf
 system), and feeder calves (grown on annual winter grazing).

 Abstract: This report presents a detailed analysis of 1970
 farm business costs and returns for small grain farms in
 northern east central North Dakota. The farms surveyed were
 divided into four size groups in order to compare farm
 organization, returns, and costs. Enterprise organization and
 crop yields changed very little among farm size groups. Just
 over 30 percent of the cropland was devoted to wheat or durum
 and slightly over 40 percent was summer-fallowed. Both labor
 earnings and rate of return on investment increase with the
 size of the farm. The higher returns on larger farms were due
 mainly to lower per acre labor costs including operator labor.
 Only small per acre cost savings were shown in machinery.

Abstract: Linear programming is used to develop profit
maximizing farm plans for three sizes of farms in Southeast
Central North Dakota. Wheat, fertilizer, and fuel prices were
varied to analyze their effects on the most profitable cash crops
plans. Wheat and sunflowers were most profitable cash crops
using historic price relationships. Summer fallow was a
profitable practice only at very high nitrogen prices. Hog
farrowing was the most profitable livestock enterprise.
Changes in wheat prices tended to change the most profitable
mix of small grains and flax but had less effect on the
acreage in sunflowers in the plan. Increases in fertilizer
prices tend to make flax profitable relative to wheat and
reduce fertilizer application rates. High fuel prices had
little effect on farm plans but reduced net income.

Abstract: The structure of the agricultural land market in
two subareas is described and analyzed on the basis of survey
information collected in Imperial and Tulare counties. USDA
information for these areas is included for comparison.
Selected characteristics of the farm real estate market
studied include description of participants (buyers and
sellers) and reasons for transfer; information on price
determination and financing arrangements is also given. There
are apparent differences noted in some characteristics
associated with transactions in the two study areas. Thus,
there is clear indication that local phenomena affect and
condition the structure of California's agricultural land
markets. Many of the differential characteristics apparently
are associated with the varied mix of resident (largely
farmers) and nonresident buyers noted in the two study areas.
The report will be useful to farmers, lenders, brokers,
investors, tax authorities, and other decision makers who need
information about California's farm real estate market.

Abstract: This study examines the cattle growing operation in view of the increased demand for and decreased supply of feeder cattle. The growing period is defined as the time of weaning until cattle are placed on a high concentrate ration for finishing. The study describes (1) physical and economic characteristics of procurement of feeder cattle by the feeder cattle grower in Kansas and Nebraska; (2) physical and economic characteristics of selling of feeder cattle by the feeder cattle grower in Kansas and Nebraska; (3) extent of vertical coordination of the cow-calf, growing, and finishing stages of production with the grower owning his own cow herd, with the grower finishing purchased calves, with the grower custom feeding or growing, and with the grower contracting for procurement or selling of feeder cattle; and (4) the historical and potential future trends in feeder cattle marketing.

Abstract: Government field crop commodity programs have become increasingly expensive in recent years. Hence, a determination of both the direct effects on the crops controlled by the programs and the indirect effects on competing crops is of evident importance. Accordingly, the major objectives of the study include both the development and the application of a model for the quantitative analysis of government program impact on the supply response of a large set of competing crops. Since one of the primary goals of government farm policy is the stabilization of farm prices and income, any econometric model to be used in the analysis of government program impact on supply response must surely include the possibility of response to changing risk.

Accordingly, by employing decision theory and the economic theory of risk bearing, the first part of this study deals with the development of an econometric model for production decisions in an economic environment of changing risk. Although the model was developed for the specific purpose of application in the field crop sector, it is presented in a general framework and is possibly applicable in a much broader class of problems.

Abstract: While farm size increases, the number of farmers decreases. Factors contributing to this include a low return to agricultural labor, the "cost-price squeeze", and development and adoption of capital intensive technology. As capital is substituted for labor, annual fixed cost increases, encouraging the spreading of this cost over additional output units. This is an incentive to increase farm size and production through growth. This paper presents a dynamic linear programming model allowing growth through a number of expansion activities. A base situation is presented with different models for various levels of available capital, interest rates, wage rates, and land availability. The most rapid growth was caused by renting land, raising swine and utilizing a basic corn-soybean rotation. Capital is limiting and therefore very important as it determines the rate of growth. Assumptions of linear programming contributing to rapid growth are planning under perfect knowledge of present and future and perfect divisibility.

Abstract: The Texas A&M Farm and Ranch Management Game is designed to give students or student teams practice in making farm and ranch management decisions in a laboratory setting. Decisions are made on the number of acres to buy or lease, acres of the various crops to be grown, fertilizer levels on each crop and the number and type of livestock to be kept. The model then calculates the machinery, building and labor requirements, crop and livestock yields, purchases machinery and buildings as required, borrows money if needed and performs other necessary financial calculations to print out the results. The model may be used for any number of teams in one run. Output is a listing of the acres of crops and number of livestock raised, yields and prices received, machinery and buildings purchased, an income statement, a net worth statement and a flow of funds summary.

Abstract: This study utilizes the technique of linear programming to determine the value of additional land of varying qualities to an existing farm operation. The annual income effects of additional land were capitalized into land values. Based on price situations and production alternatives considered additional row crop land would be worth over \$600 per acre, while additional units of the lowest quality land would have little or no value in terms of income effect.

 Midwestern corn farms: economic status and the potential for
 large and family-sized units
 Krause, Kenneth R; Kyle, Leonard R
 USDA Econ Res Serv Agr Econ Rep 216. 53p Nov 1971
 A281.9 AG84A

 Source: USDA Doc Type: MONOGRAPH Location: AGE
 Abstract: Buying and selling advantages are greater than
 internal economies for large versus family-sized Midwestern
 corn farms. Rates of return on investment both before and
 after income tax costs are considered are greater for the
 large operations because of (1) economies of size, (2) use of
 financial leverage, and (3) activities, such as those of
 purchase and sales agents, that enhance buying and selling
 advantages. Large units produce a small percentage of total
 U.S. corn. Family-sized units will probably be the most
 important units in Midwestern corn production for some time
 because of their present large number and the difficulty of
 establishing new large units. Most of the large units of the
 future will probably evolve from present family-sized units
 with aggressive growth strategies.

Abstract: This paper discusses methodology, and presents an
application, whereby an optimum temporal allocation of an
exhaustible resource can be determined. Emphasis is on the
Texas High Plains underground water supply. Among the items
considered are: (1) impact of alternative discount rates on
present value of the water resource and (2) "cost" or loss in
the present value of the exhaustible water supply due to
non-optimum cropping patterns and annual water use rates. The
study indicates that recursive programming (maximizing annual
net returns to a resource) will not necessarily maximize the
present value of an exhaustible resource.

Extract: The major purpose of this study was to examine the
potential economic effects of increased crude oil and natural
gas prices on corn and soybean production on cash grain
farming in southeastern Michigan. Specific objectives of this

research were: (1) to determine the optimal crop mix and
scheduling plan under current conditions which maximizes the
profitability of cash grain farming in southeastern Michigan;
and (2) to appraise the adjustments that a farm manager should
make in crop mix and scheduling plans with (a) changes in
energy prices, or (b) changes in relative prices of corn and
soybeans.

Abstract: This study studies the nature of the relationship
between farm size and production costs of beef cattle-small
grain producers in southwestern North Dakota. Minimum cost
linear programming was the principal analytical technique
employed. Least cost farm plans were developed for six sizes
of beef cattle-small grain farms participating in 1971
government farm programs. Wheat was the dominant crop in all
farm plans, and all farms maintained beef herds. Substantial
economies of size were found to exist. Two-man farms had
considerably lower costs than one-man farms. Future cost
reductions were observed when the full-time labor force was
expanded to three men.

Abstract: Production economics literature contains many studies which assume that the producer's goal is to maximize profits. This study tests the hypothesis that Bernoullian and lexicographic utility are more accurate predictors of farmer behavior than profit maximization. Six large California farms were used to test the hypothesis. After-income tax E-V (expectation-variance) boundaries were developed for each farm and utility, and profit maximizing crop plans were determined for each. A goodness-of-fit criterion showed that Bernoullian utility formulations provided the greatest accuracy in predicting actual and planned crop patterns, followed by the lexicographic formulation. Profit maximization showed the poorest predictive power.

Abstract: In 1969, New York's real property tax law was amended to provide exemptions for capital improvements in farm real estate. This legislation is intended to encourage investment in farming and avoid the premature idling of farmland that occurs under the threat of excessive property tax burden. This study examines participation during the first two years this law was in effect. Farmers were interviewed to determine the effects of receiving a real estate exemption on their investment decisions.

Abstract: This report discusses why peanut policy is
stressed, sets out several issues relating to such policy,
presents a summary of economic research on 6 policy
alternatives, considers several aspects of a target price
policy, and discusses some policy related issues. Peanut
program alternatives discussed include the 1971 Peanut
Program, an acreage reduction program, a voluntary certificate
program, a two-price plan, a target-price policy, and a
two-price, target program. Results presented include estimates
of peanut production, peanut receipts, gross farm receipts,
government costs, farm employment, and returns to operator
labor, family labor, and management for each program
alternative for 1971, the base period. The two-price, target
program alternative, which resulted from combining the
two-price plan and target price policy, had the potential of
conforming most closely to the objectives of maintaining or
increasing operator's incomes, reducing or eliminating
government costs, maintaining or increasing farm employment,
and assuring consumers an adequate supply of peanuts.

Abstract: How to estimate fixed and variable costs of owning
and operating farm machinery is essential knowledge for
today's farmer since such costs are major items of expense and
often are the cause of farm business failure. This paper
discusses methods and considerations in making annual cost
estimates and presents suggestions for preventing these costs
from getting out of hand.

Abstract: The objectives of this study were: 1) to relate
financial goals and attitudes of farm operators toward credit
to farm size and financial growth, and 2) to identify the
relationship of selected factors to farm size and financial
growth of Grade A dairy operators. Data were obtained by
personal interview of Grade A dairy farmers in West Tennessee.
Findings indicate that a favorable attitude toward credit is
desirable for increasing net worth. Those farmers who had a
favorable attitude toward credit but expressed a concern for
the effect that credit use would have on the total operation
appeared to be most successful in increasing net worth. The
farmers normally expressed goals in physical accomplishment
terms rather than monetary terms. The goals were expressed,
however, most often in terms which would lead to financial
accomplishment. Farmers expressed desires of reaching some
level of satisfaction rather than seeking to maximize monetary
returns. The farm size model included number of credit sources
used, initial net worth, number of years engaged in Grade A
dairying, average production per cow, and educational level as
explanatory variables.

Abstract: Family farms and large-scale farming operations continue proportionally almost unchanged in their traditional regional locations. Family farms account for the bulk of farm production in the north-central part of the country. Large-scale farming is, as it always was, the rule in California, Florida, and some other States. Farming in the rest of the country is in between; family farms have a slight majority. For the country as a whole, family farms accounted for 95 percent of all farms and for 63 percent of all farm products sold in 1949. In 1969, these proportions were 95 percent and 62 percent.

Abstract: The relationship between reductions in real property taxes and farm real estate values is investigated. Average per acre value of farm real estate in North Carolina is regressed on the tax rate and other variables relating to farm size, land productivity, urban influence, and recreational demand. The results indicate that property tax reductions for farm real estate are largely capitalized into higher real estate values. The effect of a given decrease in tax rate for owners of farm real estate is contrasted with a similar decrease for owners of residential real estate.

Abstract: Aggregate changes in forms of vertical coordination in agriculture proceed slowly even when striking changes occur in individual farm commodities. Judgment estimates of the proportion of total farm production under some form of either contracting or vertical integration show an increase from about 19 to 22 percent of all farm output from 1960 to 1970, a shift of 3 percentage points. More increase in these forms of coordination took place in livestock than in crop products, especially in fed cattle, eggs, and turkeys.

Abstract: Use value taxation for farm real estate and
proposals to reduce the use of property taxes in financing
local schools have received widespread attention throughout
the United States in recent years. This report presents the
results of a study designed to provide information necessary
to determine how these (or other) proposals to reduce property
taxes are likely to affect owners of farm real estate. A brief
description is first presented of property taxes as they are
administered in North Carolina. A model is then formulated to
determine the extent to which changes in property taxes are
capitalized into farm real estate values. The average value
per acre of farm real estate on a county basis in North
Carolina is regressed on the tax rate and four other
categories of explanatory variables relating to agricultural
productivity of land, farm size, urban influence, and
recreational demands. The estimated relationship explained
about three-fourths of the variation in farm real estate
values. all explanatory variables had the hypothesized sign.
Results indicate that property tax differentials are largely
capitalized into real estate values.

Abstract: The corporation offers an alternative
organizational form for farm businesses, even though less than
one percent of the nation's farms are now incorporated. Since
the act of incorporation creates a new legal entity, serious
advance study should be given by farm families. Traditional
advantages and disadvantages of corporations are examined for
their applicability to farming conditions. For example, the
advantage of limited liability may be negated if an individual
shareholder is required to personally co-sign debt instruments
of the incorporated farm. The potential disadvantage of
"double-taxation" through regular corporations may not hold if
Subchapter S status is elected to permit net earnings to pass
through to shareholders or if the corporate income is
exhausted in salaries to shareholder-employees. Such factors
provide a framework for analyzing, with the advice of
attorneys and others, the feasibility of incorporating a
particular farm. For general information, the steps in
organizing a corporation are cited.

Abstract: Labor inputs in agriculture have decreased
relative to land since the 1930's, and technological
innovations have become the primary source of increased
agricultural output, involving the substitution of capital for
labor and land inputs. Adoption of new technology may increase
output or may decrease resource inputs, resulting in an
increase in output per acre of land and per man-hour. The
impact of technology has changed the structure of agriculture
from an industry which utilized 95 percent of the total labor
force to feed the nation in 1790 to an industry which in 1969
produced adequate food and fiber for the nation with only five
percent of the total labor force employed in farming. The
total number of farm workers in North Dakota in 1947 was
153,000 and has declined each year since. In 1969, the total
was 60,000 which is a 61 percent decline in 23 years. If the
rate of decrease continues as projected there will be a
reduction of about 31,000 farm employees between 1969 and
1985. In resource adjustment in agriculture, it is the human
resources that are being removed. This adjustment will
continue into the future.

 Abstract: Correlation analysis. T-tests, scatter diagrams, regression, and tabular techniques were applied to data from 48 large New York dairy farms. The different techniques confirmed each other. The more complicated statistical methods confirmed what experienced observers had concluded from simple tabular analysis.

 Abstract: Farms hiring employees with low skills tended to have higher employee turnover. However, the pay was usually as high or higher for those leaving as those staying. This was because several low skilled employees were hired more recently, paid higher wages, and yet, left more frequently than low skilled employees hired earlier. Most employers indicated full-time labor was scarce regardless of the employee skill level. Farms having labor problems appeared to be increasing. Of the 85 employers who planned to continue hiring between 1969 and 1975, 84 percent expected labor problems. About half of those anticipating problems would

compete for full-time labor. However, several indicated they would take steps to reduce labor needs. Adjustments for past problems were mainly increasing mechanization and shifting to enterprises requiring less labor. Employers and employees were asked questions relating to working conditions and employer-employee relation. Evidence of labor management problems existed on several farms.

Abstract: An examination of pay packages of full-time employees on farms with a large hog operation indicated some differences in perquisites desired and received. Although the average number of benefits desired and received were about the same, many more workers desired health insurance and retirement benefits and fewer desired utilities and holidays off than received these. When the employee's rank of importance of noncash benefits were considered as well as number desiring, housing had the highest relative importance--followed by vacation with pay and farm food. These differences varied by skill, age, and particularly marital status of employees. Cash bonuses were paid to 61 of the 98 employees and averaged \$273. Incentive payments were paid to nearly one-fourth and averaged \$1,038. Purposes and advantages of incentive payments and bonuses usually differ. Much careful thought should go into establishing an incentive plan. Wages were usually paid on a monthly or weekly basis. Yet, an hourly pay basis may increase labor efficiency and employee satisfaction.

Abstract: A study of Iowa commercial hog producers hiring full-time labor indicates that non-cash extras make up a significant proportion of total pay package. The value of these perquisites averaged 24 percent of the total pay. An objective was to look at the differences in pay by characteristics that were significantly related to the pay level. Results indicated that those in the higher skill category received over \$1,000 more than those in the lower category. Married employees averaged over \$1,300 more than single employees. Pay was higher for the middle-age groups and lower for the younger and older workers. Other important variables included distance to nearest large town, education of employees, education of employers, size of hog operation, and ratio of man months of hired labor to operator and family labor.

Abstract: The declining number of farms and farm workers have been accompanied with a large number of job orders for farm employees. This points to adjustment problems in a dynamic agriculture. With the substitution of capital for labor in farm production over the last several decades, the quantity of labor used has greatly decreased. However, the quality of labor required on highly mechanized farms has greatly increased. The objective of employers on business-type farms is to secure dependable, skilled employees who have abilities and interests to "really make the capital perform." a century ago, the objective was to secure the workers with the greatest brawn. Studies have been initiated to look deeper into the problems of securing full-time labor on some commercial farms in Iowa. Although existing data indicates lower average wage rates in farming than in manufacturing, other factors such as tax breaks on perquisites, lower transportation costs and lower living costs tend to narrow the gap in the economic well-being between workers in either type of employment.

Abstract: The capital and credit needs of Virginia farmers have increased dramatically in recent years, and the evidence indicates that this trend will continue. Lending institutions supplying credit to farmers can expect to be faced with a rising demand for credit. Since 1950, the Federal Land Banks have doubled their share of the farm-mortgage debt in Virginia. Banks are still the major institutional supplier of non-real estate credit, but their share of the total has declined substantially since 1950. The share of non-real estate credit provided by Production Credit Associations has increased rapidly in recent years. Many banks in rural areas have encountered problems because farms have grown faster than the banks serving them, and banks have received loan requests that exceeded the amount they could legally lend. Because of the laws concerning branch banking, the problem of loan requests exceeding the legal lending limit is not serious in Virginia. The increased activity of bank holding companies in Virginia may have significant implication for Virginia farmers and rural residents.

 Abstract: An assessment was made of how well results of experiments with nitrogen fertilizer on corn apply under farm conditions in Illinois. This assessment was based on a comparison of experimental response functions with results of a survey of yields. Estimates of differences among farmers in the application rates were used to make the comparisons. A similar assessment was made which compares experimental results with some response functions developed by the USDA that were based on judgments of agronomists familiar with experimental data and farm practices. The consequences of a limitation on fertilizer use in the form of restricted application rates depend on the rate distribution before and after the restriction. Therefore, it is important to take into account changes in the distribution of rates which may occur under regulation. The change in average per acre corn yield resulting from various nitrogen fertilizer restrictions is calculated for eight regions in Illinois.

 Abstract: This study analyzes the economic performance of the proportional-profit sugar farms of Puerto Rico during 1950-62. The farms were established on lands acquired by the Puerto Rican Government under provisions of the Land Law of 1941. Net income from the farms is distributed to farm labor in proportion to wages received. The proximate goals of the program were the elimination of corporate latifundia, maintenance of productive efficiency, and wider distribution of benefits from the farms. The analysis shows that stated goals of eliminating corporate latifundia while retaining production efficiency were only partly achieved by the program. Also, the state goals were in conflict with broader goals of economic policy--growth, full employment, and high sugar-export levels. The policies followed were consistent, however, with economic development objectives of the 1950's and later years.

Abstract: The objectives of this study were to examine the extent and seriousness of income problems faced by small farms in a relatively small geographic area, determine the causes of these problems, explore various alternatives by which small farms could improve their economic position, and make recommendations for educational programs which would allow small farms to pursue these alternatives. To attain these objectives, 78 small dairy farms in Chenango and part of Otsego counties were interviewed.

Abstract: This report contains responses of Washington farmers to questions about their machinery management practices. Unreliability of old machines was the most common reason farmers gave for replacing a machine. Most farmers, when replacing an old machine, bought a new one. More than half of all tractors replaced needed major repair. For most farmers, income tax had little effect on the decisions to buy a machine. Only 39% of the farmers had ever leased machinery, while 90% had hired custom work done on their farms.

Abstract: This report indicated expected adjustments in a profit maximizing farm organization due to changes in the prices of wheat and stockers and in government farm programs. Three separate grazing methods for the wheat pasture were considered--owning stockers, gain lease arrangement and stocker month lease. Alternative pull out dates for stockers were included and ranged from March 1 to June 2. The most profitable grazing method for the wheat farmer was owned stockers, followed by gain leasing and then stocker month leasing. In all cases it was profitable to graze the wheat pasture even if a stocker month lease arrangement was the only grazing method available. The effect of changing conditions on the optimum organization of wheat production and stocker grazing was estimated by varying, separately, the price of wheat, stockers, lease rates, and government set-aside payments. As stocker prices increase grazing termination dates were later, grain production declined, and beef production increased. When stocker prices were \$50.89 per cwt and wheat was \$2.00 per bushel, wheat was grazed to such an extent that no wheat was harvested.

Abstract: Estimates were made of the differential effects of technological change in the form of supply cost reductions on the implied relative income changes of agricultural producers in a 14-state area of the Midwest during a postwar period (1950-1965). The primary objective of the study was to separate the economic effects of technological changes from all other economic and climatic factors by using and extending the results of completed and on-going research studies in the technology area. The individual and cumulative effects of three technologies (fertilizer, varietal improvement, and other technological factors) on crop yields and net returns per acre per year were estimated for six field crops produced in the Corn Belt, Lake States, Northern and Southern Plains regions. Five livestock and poultry-animal product classes were evaluated to determine the effects of changes in feed conversion ratios and other factor costs on the supply costs for animal products, taking into consideration the cross-elasticity effects on the demand side.

Abstract: The four proposed programs for general cropland retirement that were analysed in this study for the United States would affect (1) location of cropland retired, (2) direct costs to the Government, and (3) remaining production potential. For both part-farm and whole-farm retirement, the retirement criteria used were (1) the acreage criterion, which minimizes the Government's cost per acre retired and (2) the production criterion, which minimizes the Government's cost per unit of production retired. Considered for policy implications were program impacts on (1) farm income, (2) resource adjustments, (3) Government cost, and (4) social and economic conditions in rural communities.

Abstract: The authors describe average per acre costs for the three major sizes and types of combines used for wheat harvest in eastern Washington. These costs are calculated as functions of average yields and annual use. The operating costs represent existing average field conditions within the study region. The calculated costs are \$26.45 per acre for an 18 foot hillside combine assuming a yield of 100 bushels per acre, combine capacity of 150 bushels per hour, for 100 hours of average annual use. Costs are \$1.93 per acre for an 18 foot level land combine assuming a yield of 20 bushels per acre, combine capacity of 6.3 acres per hour, for 300 hours of average annual use. These costs exclude labor, wheat hauling and storage, management, and moving expenses.

Abstract: This research had the purpose of testing hypotheses concerning the relationships of firm behavior and performance to organizational structure, external environment in which firms operated and degree of price competition. Experimental gaming in a behavioral science laboratory was used with a group of 70 managers from the farm supply industry as subjects. The results support the important influence that economic factors have on firm behavior and performance. Degree of price competition imposed by the researcher greatly affected pricing decisions. Subjects priced much closer to prices of competitors when margins were low than when they were normal or high. There were major differences in product prices and grain buying prices within and among organizational structures. This points to the importance of farmers checking prices and patronage refund policies of several outlets. The performance of small- and medium-sized proprietary firms and one group of cooperatives was rather poor in the game. This may account for the decline in number of firms and continuing problems of survival in these groups.

Abstract: The Tennessee portion of the 1% Continuous Work History Sample of the Social Security Administration was used to (1) identify the mobility and income distribution of Tennessee farm and nonfarm workers by sex and race, and (2) estimate future income-job distributions for Tennessee. These data covered the period 1960-65. The results showed that real income increased during this period and that there was a net out-migration of workers. The income of whites was greater than that of blacks, that of males greater than females, and the income of nonfarm workers greater than farm workers. Markov Analysis was used to project percentage distribution of nonfarm incomes, and of farm operators to their long-run equilibrium.

Abstract: The self-employed pose special problems in the administration of any universal income maintenance program. The major issues are the definition of self-employment, the measurement of self-employed income and expenses, the treatment of business assets, and whether limits should be placed on gross income in determining eligibility. Each of these issues is discussed in the paper, and recommendations are made.

Abstract: As part of a 15 state study employer and farm worker surveys were undertaken in West Virginia to determine the cost and incidence of coverage of agricultural employment under the unemployment insurance system. Estimates for several alternative coverage provisions are presented. With all farm employment covered, 92 percent of the survey workers would have sufficient employment and earnings to qualify for benefits if they became involuntarily unemployed, while 16 percent would actually receive benefits. Average benefits per actual beneficiary were estimated to be \$277. The ratio of actual benefits to total taxable payroll would be 1.7 percent. This rate essentially would remain unchanged under more restrictive coverage provisions, even though the proportion of covered employers and workers decline substantially. Demographic characteristics and the work force experience of the agricultural workers are discussed.

Abstract: This report investigates cohorts of the worker population and estimates the incidence of unemployment Insurance (UI) variables for future years. The incidence of beneficiaries and the benefit amounts were generally higher among interstate than among intrastate workers. Blacks generally had the highest actual benefit amounts, while whites usually had the lowest benefit amounts. The incidence of actual beneficiaries and benefit amounts was usually smaller for males than for females. The 25 to 44 age group had the highest actual benefits and the 45 and older group had the lowest. Variations existed in the UI incidence by family wage earners status, and household size, as well as in the drawing of monetary benefit entitlements and annual earnings among cohorts. Total annual earnings for all workers differed widely among cohorts. They ranged from \$1,353 for workers aged 24 or less to \$5,042 for workers who earn one-half to three-fourths of the household income. The extension of unemployment insurance to agriculture would not inflict a deficit upon the trust fund of West Virginia.

Abstract: This pilot study of 78 employers and 100 workers provides additional information on the characteristics of career farm workers, and provides some clues on retirement plans, housing arrangements, and other fringe benefits. Indications are that even among these "selected" employers with career farm workers, the labor management practices are quite uncertain. These undoubtedly are areas in which farm employers need to make improvements if they are to compete successfully in the rural labor market for good help. The results also suggest the need for research in the broad area of farm labor management practices.

Abstract: Availability of finance capital and terms of supplying it have much to do with volume and composition of farm production, the level of prices and incomes, returns to various investors, and who is going to control agriculture. Principal tax concessions relate to delayed date, or reduced rate, of payment. Policy steps could take various forms, each with strengths and weaknesses.

Abstract: Dairy farms continue to increase in size at a steady and rapid rate. The income tax structure permits a farmer, as he invests in his business, to either postpone or reduce payment of his income taxes and thereby increase the amount of internal capital available for further growth. This study reviews important income tax considerations for the growing farm. A simulation analysis is then used to illustrate the effect of alternate tax strategies on financial worth.

Abstract: In 1971, New York's legislature passed the Agricultural District Law (Agriculture and Markets Law Article 25-AA). This law is designed to encourage the continuance of a strong agricultural industry in the face of growing urban pressure and speculation. A brief summary of law is presented followed by the complete text of the law. All the amendments passed through 1974 have been incorporated into the text of the original law.

Abstract: A new law in New York State is intended to encourage continued farming where speculation and other urban influences otherwise would bring it to an end long before nonfarm uses are ready to occupy all of the area. This law offers a package of aids and incentives to farmers who form agricultural districts under its provisions. It also provides some positive discouragements to nonfarm developments within these agricultural districts. The New York agricultural district law is quite different from anything tried so far in any other state. It is believed that the package of provisions in the New York law will lead to the long term dedication of many areas to farming, but the law is constructed so that an orderly transfer of land from farming to urban uses is possible.

Abstract: This study examines the problems which urban expansion brings to farming and recommends policies related to them. It focuses on two areas of New York, one near Syracuse and the other near Rochester. Among the findings was the fact that speculation is a major disrupter of farming in the belts or urban influence that surround our cities. Speculation disrupts farming by discouraging investment in permanent improvements that are necessary for viable farm businesses.

Abstract: State sales and income taxes and local property taxes generally absorb a higher percentage of the income of farmers than of nonfarmers, according to an Iowa incidence study. Simple models of voting behavior show higher tax burdens may cause farmers to be more conservative toward public spending than other taxpayers, even though their demand for public services is identical.

Abstract: Economic literature identifies development with average rates of increase in real output per capita. Little research has focused on interrelations between productivity increases and other indicators of development such as the reduction of mass poverty, unemployment, and inequality. Such omissions may be a function of the way agricultural economics developed in the United States. Here a positive correlation between increased production, employment, and income-earning opportunities was assumed inherent in the family farm system and the relative labor-scarce conditions. Problems emerging in recent years throw considerable doubt on the appropriateness of these assumptions.

Abstract: Missouri farm leaders believe farmers are underpaid, that the current farm program is the best among several choices, that outside investors hurt their income, that the family farm is efficient yet income is more important than family-farm status, that farmers' cooperatives are needed but farmers ought to exert more control, that collective bargaining has a place, and that rural development is mainly a way to get more off-farm jobs.

Abstract: Work force and Unemployment Insurance system variables were important in determining cost rates of U.I. to states. Removing the variation introduced by work force characteristics by using a standardized work force in computing U.I. statistics for each state made it possible to demonstrate that due to differences in system variables, workers would in one state obtain average total benefits almost double those available from another state. Statistical tests confirmed the hypothesis that there were significant differences among states for this standardized work force with respect to the proportion of insured workers, beneficiaries, benefit exhaustees, total and weekly benefits, average weeks of compensated unemployment, and benefit-cost ratios. Regression models predicted cost rates for the 48 contiguous states on the basis of Census and U.I. program data. These models included work force characteristics (unemployment, employment, and wage rate) and system variables (benefit payment schedules and monetary earnings requirements) as variables. The overall U.S. cost rate was predicted to average 3.8 percent.

 Abstract: This report investigates cohorts of the worker
 population and estimates the incidence of unemployment
 Insurance (UI) variables for future years. The incidence of
 beneficiaries and the benefit amounts were higher among
 interstate workers. Whites and blacks had the lowest incidence
 of actual beneficiaries. Whites also usually had the lowest
 actual benefit amounts. The incidence of actual beneficiaries
 and benefit amounts were usually smaller for males than for
 females. Actual benefit amounts were usually lowest among the
 older workers, and higher for the younger workers. Variations
 existed in the UI incidence by family wage earners status and
 household size, as well as in the drawing of monetary benefit
 entitlements and annual earnings among cohorts. The extension
 of unemployment insurance to agriculture would inflict upon
 the trust fund of Delaware a minute deficit not exceeding .2
 percent of the fund under both the standard and maximum rates
 of assessment given 1969-1970 conditions.

 Extract: The analysis reported here is restricted to
 citrus harvesting labor. This market has been selected for
 several reasons. First, more hired labor is employed in citrus
 picking than in any other agricultural activity in
 Florida. secondly, the harvesting of citrus is characterized by
 a structureless labor market. More precisely, no technical
 change has occurred to significantly affect labor usage
 through the potential substitution of capital for labor.
 Consequently, the operational assumption of historically
 constant labor productivity is tenable in analysis of citrus
 harvesting labor, while it might prove untenable in a study on
 picking labor in other fruits and vegetables. Third, due to
 increasing labor costs, the mechanical harvesting of citrus,
 including only two percent of the 1974-75 crop, represents an
 area of concern to the industry. in addition, it is fortunate
 that reliable wage and employment time series data are more

Abstract: This study was designed to examine the reasons behind Oregon's high workmen's compensation insurance rates relative to other states. The workmen's compensation experience data come from the years 1965-1970, and include 44 states, omitting Nevada, North Dakota, Ohio, Washington, West Virginia, and Wyoming. Factors such as rating formula, losses by type of claim, average cost by type of claim, frequency per type of claim, statutory benefit levels, hazarousness of industrial mix, and wage rates were examined as potential causes of Oregon's high rates relative to other states. The analysis indicated that Oregon's workmen's compensation insurance rates are high relative to other states because of the statutes pertaining to determination of permanent partial disability and permanent total disability claims, and interpretation and application of those statutes.

Abstract: Using the basic input-output model developed by the Texas Input-Output Project for a 19 county South Texas Region, income transfer effects from the extension of unemployment insurance to the agricultural sector are derived. Total income transferred would have ranged from \$1.4 million to \$2.3 million depending upon coverage provisions selected. About one-half of the transfer would have been from outside the region. The average income of the eligible agricultural employment would have been increased by \$311. Employment effects from increasing agricultural output in the Region are estimated. Although high direct total employment effects are obtained for the agricultural production industries, most of the increase is due to expanded seasonal employment. Only the vegetable, citrus and irrigated crop industry ranks among the top 20 industries in employment generating ability, exclusive of seasonal workers. Policy alternatives, in addition to unemployment insurance, which are designed to minimize the

adverse economic effects resulting from rapid expansion of seasonal employment are discussed.

Abstract: An increasingly large proportion of Illinois farmers has combined farming with off-farm employment. Dual employment provides a productive outlet for excess farm labor but, more importantly, supplements farm incomes to more satisfactory total family income levels. In fact, a large number of Illinois farm families now earn a higher income from nonfarm sources than from farming. Various farm size characteristics affect the level and composition of the total income stream to Illinois farm families. This report identifies the effect of several farm size characteristics on the level of off-farm earning by the farm family. Commercial as well as small farmers depend on off-farm income for a significant share of their total income. Many farmers may find higher returns to excess labor through dual employment rather than by further intensifying their farm enterprises.

Abstract: The primary objective of this study was to evaluate the resource base of low-income farmers and analyze the availability and use of credit by those farmers. Data were collected from 77 farmers with less than \$8,000 gross income in Franklin and Richland Parishes. Data indicated farm income could be expanded through more intensive or expanded use of tillable acres, adoption of current farm management practices, investment in more modern machinery and equipment complements, and increasing financial leverage from borrowed capital. Farmers exhibited a reluctance to borrow although their equity position qualified them for additional credit. Furthermore, farmers indicated sufficient credit sources were available to supply their operating, intermediate and long-term credit requirements.

 Abstract: This report examines the possible effects of
 lignite coal development on agriculture and rural communities
 in North Dakota. Future coal development may involve increased
 production of coal for export, construction of more coal-fired
 electrical generating facilities in the region, construction
 of plants to convert lignite to liquid or gaseous fuels, or a
 combination of these alternatives. The impacts are studied in
 terms of an eight-county area in southwestern North Dakota.
 Agriculture is the dominant land use in the area. The impact
 of coal development on agriculture will include competition
 for land, competition for water, and competition for labor.
 The impacts on rural communities will arise from increased
 employment, population, and business volume in the area.

Abstract: This report is part of an overall study of woods
labor designed to identify, analyze and evaluate opportunities
for increased utilization of rural manpower. A sample of
nonindustrial forest owners of which 20 percent were farmers
was interviewed in Carroll, Coos and Grafton Counties in
Northern New Hampshire. Representative dairy farm situations
were selected from those male operators under 65 years of age
who indicated a desire to increase or initiate woods
operations. Linear programming models were developed to
determine optimum labor utilization. Labor efficiency in both
dairy and woods work was assumed to vary and estimates of
potential income were developed for 4 levels of dairy
management efficiency and 4 levels of woods labor efficiency.
Additions to farm income associated with utilization of labor
in woods work varied in relation to the assumed levels of
labor efficiency in the dairy operation as well as woods work.
In general, income potentials were sizable and woods work
appears to be an important production adjustment.

 Abstract: Minimum wage legislation which results in higher
 average wage rates for farm laborers would affect the asset
 structure and income flows of farm operators. A simulation
 model of financial structure of the farm sector is used to
 show that higher wage rates would result in increased nonreal
 estate assets and debt relative to real estate assets and
 debt. Proprietors' equities would decline. Simulation results
 indicated that reductions in net farm income due to higher
 wage rates would be partially offset by higher nonfarm income
 of farm operators and their families.

 Abstract: The Hired Farm Working Force of 1970 (HFWF)
 consisted of about 2.5 million persons 14 years of age and
 over who did some farmwork for cash wages during the year.
 This decline of 4 percent from the 2.6 million in 1969
 reflects further utilization of farm laborsaving
 technology. members of the 1970 HFWF were mostly young (median
 age 23). white (78 percent), male (76 percent), persons living

in nonfarm places (73 percent). They earned an average of \$887
 in cash wages, or \$11.10 a day for 80 days of farm wage work.
 Only 22 percent were engaged chiefly in farm wage work. Of
 these, 306,000 were year-round workers, who were the most
 fully employed and highest paid, averaging 318 days of farm
 wage work and earning \$3,467. About 56 percent (primarily
 housewives and students) were not in the labor force most of
 the year. About 196,000 or 8 percent of the total, were
 domestic migratory workers. This was a drop of 24 percent from
 257,000 in 1969, while the remainder of the hired farmworkers
 declined by only 1 percent.

Abstract: The Hired Farm Working Force of 1971 (HFWF)
 consisted of about 2.6 million persons 14 years of age and
 over who did some farmwork for cash wages during the year.
 This slight increase, 4 percent, from the 2.5 million in 1970
 reversed the declining trend in process since 1967. Members of
 the 1971 HFWF were mostly young (median age 22), white (78
 percent), male (76 percent), persons living in nonfarm places
 (73 percent). They earned an average of \$882 in cash wages, or
 \$11.60 a day for 76 days of farm wage work. Only 19 percent
 were engaged chiefly in farm wage work. Of these, 285,000 were
 year-round workers, who were the most fully employed and
 highest paid, averaging 317 days of farm wage work and earnings
 \$3,799. About 58 percent (primarily housewives and students)
 were not in the labor force most of the year. About 172,000,
 or 7 percent of the total, were domestic migratory workers.
 This was a drop of 12 percent from 196,000 in 1970 and a
 continuation of the 4-year declining trend in migrant numbers,
 while the remainder of the hired farmworkers reversed the
 downward trend and increased by 4 percent.

Abstract: The Hired Farm Working Force of 1972 (HFWF) consisted of about 2.8 million persons 14 years of age and over who did some farmwork for cash wages during the year. This was a 7 percent increase from the 2.6 million in 1971 and continued the increase which began in 1971 after a continuous decline in the number since 1967. Members of the 1972 HFWF were mostly young (median age 23), white (85 percent), male (77 percent), persons living in nonfarm places (72 percent). They earned an average of \$1,160 in cash wages, or \$13.20 a day for 88 days of farm wage work. Only 24 percent were engaged chiefly in farm wage work. Of these, 367,000 were year-round workers, who were the most fully employed and highest paid, averaging 306 days of farm wage work and earning \$4,358. About 52 percent (primarily housewives and students) were not in the labor force most of the year. About 184,000, or 7 percent of the total, were domestic migratory workers. This was an increase of 7 percent from 172,000 in 1971 and reversed the declining trend in the number of migrants which began in 1965. The remainder of the hired farmworkers, the nonmigratory, increased 9%.

Doc Type: MONOGRAPH Location: AGE

Abstract: This study gives a partial analysis of the impact from coverage of extension unemployment insurance to the individual industries within the Texas agricultural sector. It concludes that the trend in Texas toward consolidation of farms into larger operations permits inclusion of a substantial number of the Texas hired agricultural labor force under the unemployment insurance program by extending coverage to a relatively small portion of employers. Definitions of unemployment insurance related terms are provided. The study is divided into two major sections; the agricultural employer population, and the agricultural employer distributions and benefits and costs rates. In the former, participation by type of employer, principal product sales and economic class are studied by employer participation, extent of employee coverage, leverage, and characteristics of employers. The second major division is analyzed by seasonality of work force, type of employer, and farm and economic class.

Extract: The South plays an important role in American agriculture in that it is a major supplier of several commodities. However, due to relatively low yields, the region is a marginal producer of some important farm commodities grown in the United States. Given this constraint, the South still offers the greatest potential for expansion of agricultural output of any region in the country. The purpose of this paper is to evaluate this assertion. A rather broad perspective with implications for future research is provided.

Abstract: The purpose was to determine farmer attitudes towards various discounting and pricing policies; associations between attitudes and characteristics of farmers; and frequency of discounts by cooperatives and non-cooperative suppliers of feed, fertilizer, and petroleum products. In general, the farmers interviewed were not opposed to paying added charges for credit purchases and for farm deliveries. More than four-fifths of the farmers felt businesses should give pick-up discounts. Over three-fourths of the respondents favored cash and early season booking discounts. Farmer opinions about cash discounts, pick-up discounts, and early season booking discounts did not appear to be influenced by education, gross farm income, or cooperative membership. Volume discounts were fairly common and favored primarily by larger farmers. In general, farmers having a cooperative major

Abstract: A study of Iowa farms hiring full-time labor and having hogs as a major enterprise revealed that the average size of these farms was over three times the average Iowa farm. Most of the farm businesses were single proprietorships. However, nearly 20 percent were partnerships. The average age of employers was 48 years as compared with 39 years for employees. The education level again was higher for employers--averaging nearly 12 years as compared to 9.4 years for employees. Agricultural education and recent farm management training were received by less than half of the employers and even fewer employees. Most of the full-time employees and their wives had rural backgrounds. Several employees were skilled and nearly half had been employed by nonfarm businesses between 1959 and 1968. About 80 percent indicated a personal preference for farm work. Nearly half planned to remain employed in the same position in the future. Fourteen planned to take nonfarm jobs and most of the rest aspired to higher positions in farming.

Abstract: Behavioral and affective forms of membership involvement are compared on the basis of data collected from members of three farm organizations in Wisconsin. The relative effect of selected independent variables on each involvement form is the key problem of this article. The rank order of independent variables as determined by the size of their partial beta coefficients varies considerably between the two forms. However, when the immediateness of the variables is considered, specific attitudes are found to account for a larger percentage of the variance in both involvement forms than are general attitudes or social background characteristics. The results of the study suggest the need for developing models of involvement, the necessity of using multivariate techniques, and the potential contribution of path analysis to an understanding of membership involvement.

Abstract: There were 2,012,000 households in 1971 that contained at least one person who performed farm wage work during the year. In terms of type of farm wage work, 81 percent of the households were seasonal farm wage worker households, 10 percent were regular, and 13 percent were year-round. Also 7 percent of all farm wage worker households had at least one member who performed migratory farm wage work. (because some households had more than one type of farm wage worker, these percentages total to more than 100.) farm wage worker households contained 9,108,000 persons and averaged 4.5 members per household. Of these total members, 2,550,000 (28 percent) performed farm wage work. Median family income for all farm wage worker households in 1971 was \$5,712, slightly more than half that for all households in the Nation. Approximately 37 percent of the households had family incomes of \$7,500 or more. About 29 percent of them contained six or more members.

Abstract: Control in voluntary farm organizations was analyzed by the use of data from 220 memberships in numerous local units of the Farm Bureau, Farmers Union, and National Farmers Organization in Wisconsin. We hypothesized that three aspects of control--amount, distribution, and congruence between actual and "ideal"-- would be related in a positive direction to affective and behavioral measures of membership involvement and to perceptions of income and other organizational benefits. The results are only partly consistent with those of previous studies. As expected, at least moderate correlations of involvement and benefits with amount of control are evident. Neither the hypothesis about correlations with the distribution of control nor that about correlations with the congruence between actual and "ideal" amounts of control received positive support.

Extract: This paper addresses conceptual inadequacies of
standard labor force and unemployment statistics for the
purpose of representing relative stocks of available labor
among regions. It attempts to rectify some of these
inadequacies by applying relatively simple statistical
adjustments. These are based on secondary data relating to
local population characteristics and national participation
rate norms.

Doc Type: MONOGRAPH Location: AGE

Abstract: This is the second report on the NE-58 study concerning unemployment insurance (U.I.) for agriculture. The first chapters deal with an overview of the surveyed employers and workers, their socio-demographic characteristics and U.I. coverage aspects. Benefits, the impact on worker's income and costs of the program are estimated as determinants of the cost variations between states. U.I. will have a substantial impact on the welfare (income) of about one-quarter of the agricultural workforce; but, it will have little overall impact on income levels or the proportion of workers with low earnings. The impact of the program on assumed migration patterns, likely implications for local communities and ensuing small reductions in the migratory labor supply are dealt with, as well as the negative attitudes of farm workers towards participation in U.I. programs in initial years. The place of minorities (Southern migrants and Puerto Ricans) in the agricultural labor force and their demographic makeup is analyzed. An historical review of U.I. concludes the monograph.

Timber stand improvement--an entree to forestry for small-tract owners

Anderson, Walter C

Doc Type: MONOGRAPH Location: AGE

Abstract: Entice small-forest owners into forestry with a rewarding experience, and they will finance progressively more intensive management in their woodlands. Foresters would agree that applying this theory requires more than efforts to educate owners and give them technical aid. Financial assistance has been tried in the form of cost sharing and rental payments. Two recent examples are Virginia's 1970 Reforestation of Timberland Act and the Forestry Incentives Program, authorized by the 1973 Farm Bill. The stimulus provided by such external inducements should not cause foresters to overlook opportunities within forestry which could attract the landowners. But the vague plea, "Practice forestry!" does little good. Instead, the landowner's attention must be focused on a single ideal practice. Timber stand improvement qualifies as an ideal practice because it can fulfill the desires of the typical owner.

Abstract: Income maximizing farm plans were developed for ten selected farms in western Wisconsin that were typical of that area. A 30 year planning horizon was used, at four discount rates of the future flow of income. Farm forestry enterprises competed with the usual crop and livestock enterprises for use of the available farm resources.

Agriculture? Policies Affecting the Organizational Structure
of U.S. Agriculture. Search: 19720800
Source: EXT Doc Type: MONOGRAPH Location: AGE
Abstract: Wide distribution of land ownership has been a
long established policy. Early U.S. farmers eager to farm land
of their own found much in their favor. Primogeniture was
ended. Land was first sold at low prices and then granted
almost without cost through homesteading. However,
availability of free land ended a generation ago and land has
since become scarcer, more expensive, and increasingly subject
to regulations over its use. Nonfarmers often successfully
compete with farmers for ownership of land. The authors
conclude that insofar as access to land determines the control
of U.S. agriculture, "the key answers probably come from
sources outside the agricultural sector." If farmers are to
retain any control over changes in land-use policies, they
must continuously articulate the needs and contributions of
agriculture.

Abstract: The future of Oregon's agriculture lies in its diversity and prominence in national and world commodity markets. Trends are expected to continue much as in the past unless circumstances are altered. Past gains in farm income have been due primarily to greater production rather than improving price conditions. Correspondingly, unless growers can effectively control some phase of their market, future gains also will largely come from increased production. Somewhat important developments may well be in the price area rather than production. A 20 percent gain in cash receipts might be reasonably expected by 1980 due to production gains. If farmers could increase prices received in line with general inflation (which has not been possible in the past), receipts would increase faster than if production gains alone were responsible.

Abstract: Since World War I, the planning environment of farming in the United States has changed beyond recognition, as new laws set up agencies and programs designed to improve the farmers' lot and develop a sound agricultural industry. If we are serious about improving private incentives to forestry, farm experience suggests that we should try to correct imperfections in such basic institutions as markets, ownership, credit and information.

Doc Type: MONOGRAPH Location: AGE
Abstract: Several states have passed laws to protect prime farm land, reduce environmental impacts, or eliminate off-site sediment damages. The 1971 Iowa legislature, for example, passed the Conservancy District Act to control the use of soil and water resources and thereby limit annual soil loss. Because of the inelastic demands for farm commodities, one state such as Iowa may restrain land use with the result that its farmers sacrifice income while farmers elsewhere gain income. We applied national models to determine what the outcome would be if Iowa were to fully implement its Conservancy District Act or apply other environmental restraints, such as limiting nitrogen and pesticide use. The results show that in all cases restraints implemented solely in Iowa would reduce net farm income in the state while income elsewhere in the nation would increase. Hence, national as opposed to state legislation is implied for the long run.

Abstract: The purpose of this report is to provide a
detailed technical description of the procedures employed and
presented in Part I. Included is a description of the
location-quotients procedure for simulating regional
input-output matrices, a discussion of the procedures employed
in the petroleum usage study, a discussion of data
requirements and sources, and a review of model assumptions
and limitations. Also included is a documented version of the
computer program developed during the course of study. Efforts
have been made to avoid unnecessary duplication in preparing
Parts I and II of the report. However, some repetition is
intentional so that each volume of the report can be read
independently.

Source: EXP STN Doc Type: MONOGRAPH Location: AGE

Abstract: An aggregate production function analysis of water
resource productivity in Pacific Northwest agriculture was
conducted to: (1) evaluate the economic efficiency of the
water allocation that existed in 1964, and (2) make inferences
about the social desirability of future development of
agricultural water resources. An attempt was made to isolate
the productivity of different forms of water resource
investment, including irrigation, drainage, and water
conservation practices. Estimates of irrigation productivity
on a per acre-foot basis were obtained for five subareas
within the region; independent estimates of productivity of
drainage and water conservation practices were not possible.
Ordinary least-squares regression techniques were employed to
derive estimates of the parameters of the production function
models. The parameter for the irrigation variable in each area
provided an estimate of the marginal value product (MVP) of
irrigation water in agricultural production. Statistical tests
provided estimates of the reliability of the parameter
estimates.

of production by this means. Governmental programs and technological change favorable to farm size enlargement have placed heavy pressures on land prices. Decisions for land purchase and labor hire are complicated by the fact that in many cases the unit of purchase of the input is not the same as the decision unit in production.

Abstract: Agricultural land base in U.S. appears adequate to meet food needs in the foreseeable future. Declines in cropland used in the Southeast in recent years and expansion of livestock indicate a trend toward grassland livestock agriculture. Corn and cotton acreage in the Southeast have declined greatly while soybean acreage has expanded rapidly. Trends toward larger and more commercial farms and decreased availability of seasonal hired labor indicate a need to orient farm operations more toward resident labor. Fertilizer and irrigation have been important land substitutes in the past 20 years and considerable reserve exists for additional expansion

Abstract: The economic effects of an hypothetical use-value taxation statute were estimated for a sample of towns in Vermont. A sample of landowners was surveyed to determine their attitudes towards and acceptance of the proposed law. Found farmers readily accepted the concept and over 90 percent would apply for inclusion. Forest landowners were less willing to accept the proposal. Most farms in good agricultural towns were assessed at levels below agricultural value. Farms in recreation and residential-oriented towns assessed at 5 to 15 percent above use-value. Based on estimated levels of participation, it was determined that total assessments in the 18 towns studied would have been decreased by 2.9 percent had the model statute been in effect.

times. Yet we are often influenced by concepts that were more suitable in the past. Technology has a way of marching faster than beliefs and values can respond, and this creates problems. This report considers how the existing beliefs and values about agriculture arose and how they may be adjusted to the present age. The Protestant ethic of the virtue of work, for example, and the influence of frontier psychology are reviewed. Freedom and independence and the family farm still sway our thinking although they have a different context than in Jefferson's day. Some rugged individualism may have to bow to personal and social responsibility in a modern community.

Abstract: Computerized Management Aids (CMA's) are described in terms of how many runs were made, for what purpose, and what is the direct cost of using CMA's in Extension Educational programs. An attempt is made to evaluate the benefits Extension Agents and farmers received from using CMA's. Wisconsin Extension Service, and Michigan State University.

 Abstract: As farm management education programs evolve to serve business--oriented farm firms, planning, implementation, and control functions become major areas of emphasis. Integration of three computerized management tools--a budget generator, a management game, and LP-FARM--in a farm management course provided students with practical experience in each management function.

 Abstract: Five management information systems currently available to Washington farmers were analyzed on the basis of input required for each system, the output provided by each system and the user cost of the system. Analyses were made of Ag-Data (Agrimanagement Technology), Salem, Oregon; Ag-Data, Incorporated, Walla Walla, Washington; Agrifax, Spokane, Washington; FACS (Farm Accounts Computer System), Portland, Oregon; Money-Minder, Peoples National Bank, Seattle, Washington. This report does not contain conclusions or recommendations. The major purpose is to provide a summary of the characteristics of each system.

Abstract: The topics discussed in this publication are designed to give the reader a general understanding of the following areas of planning property transfers under the framework of North Carolina law: 1) property distribution in the absence of a plan, 2) last will and testament, 3) settling an estate, 4) property transfers made before death and 5) estate and inheritance, gift and income taxes. Hypothetical situations are presented to illustrate some of the principles and methods of property transfer discussed. A glossary of terms is provided to familiarize the reader with legal terminology used in planning property transfers.

Abstract: This article reports the Kansas State experience in extensive revision of its undergraduate educational program. Revision was based on student, faculty, alumni, and employer participation. The new curriculum gives new emphasis to behavioral sciences and analytical techniques which better prepare students for agribusiness jobs.
